SYSTEMS AND METHODS FOR ALIGNMENT OF THE EYE FOR OCULAR IMAGING

CROSS-REFERENCE TO RELATED APPLICATION(S)

[001] None.

FIELD OF THE INVENTION

[002] Disclosed herein are systems and methods form alignment of the eye for ocular imaging.

BACKGROUND OF THE INVENTION

[003] In ocular imaging, proper alignment of the subject's eye is a prerequisite to quality ocular image acquisition. Traditional approaches to achieving alignment rely on a trained operator of the imaging device to adjust system optics until alignment is achieved. Other approaches use automation to adjust optical elements to achieve alignment. Both of these approaches rely on servo motors which add cost and complexity to the system. For example, manual handheld fundus cameras require the user manually positioning a camera, and often require an integrated screen to view the eye. Traditional manual desk-mounted fundus cameras require the user to manually steer the camera with a joytick to the correct alignment. Automated or semi-automated fundus cameras require complex motors, additional cameras and sensors, and built-in image processing to drive the automated alignment, thereby adding significant cost. Accordingly, there is a need in the art for an alignment system with reduced cost, complexity, and ease of operation.

BRIEF SUMMARY OF THE INVENTION

[004] Disclosed herein are is an ocular alignment system for aligning a subject's eye with an optical axes of an ocular imaging device comprising one or more guide light and one or more baffle configured to mask the one or more guide light from view of the subject such that the one or more guide light is only visible to the subject when the eye of the subject is aligned with the optical axis of an ocular imaging system.

[005] While multiple embodiments are disclosed, still other embodiments of the present invention will become apparent to those skilled in the art from the following detailed description, which shows and describes illustrative embodiments of the invention. As will be realized, the

invention is capable of modifications in various obvious aspects, all without departing from the spirit and scope of the present invention. Accordingly, the drawings and detailed description are to be regarded as illustrative in nature and not restrictive.

BRIEF DESCRIPTION OF THE DRAWINGS

- [006] FIG. 1 is schematic diagram of the system according to certain embodiments.
- [007] FIG. 2 is a schematic diagram of the system according to certain embodiments.
- [008] FIG. 3 is a schematic diagram of baffles according to certain embodiments.
- [009] FIG. 4 is schematic diagram of indicator signals according to certain embodiments.

DETAILED DESCRIPTION

[010] The present invention relates to an optical imaging system for imaging the eye of a subject which allows a subject to properly position and align its eye with the optical path of an ocular imaging system in response to visual cues from the system. This is in contrast to prior art optical imaging systems where the subject's eye position is assumed constant and alignment is achieved by adjusting the position of camera elements with respect to that eye. Thus, the disclosed system utilizes the precise oculomotor alignment system of the human eye to self align, instead of relying on the trained operators or expensive servo motors to achieve alignment.

[011] According to certain embodiments, the system comprises a camera, for example a fundus camera, having an image sensor, one or more guide lights, positioned laterally between the image sensor and the subject's eye. In certain embodiments, the system further comprises one or more baffles, positioned between the one or more guide light and subject's eye. The one or more baffle is configured to occlude the subject's view of the one or more guide light until the eye of the subject is properly positioned and aligned translationally (along x, y, z axes) and rotationally (along theta, eta, zeta axes) with respect to the optical path of the imaging device so as to provide for optimal image acquisition.

Guide Lights

[012] In certain embodiments, as best seen in Figs 1 and 2, the one or more guide light is a ring light, that is, a light forming a substantially ring-like shape. The guide light is masked by one or more baffle which according to certain embodiments, is of a substantially cone-like

shape with the wide end of the cone at the ring guide light and the narrow end near the eye of the subject. In certain embodiments, as the subject approaches the device, a coaxial light becomes visible to aid in coarse alignment of the subject's eye with the system. As the subject directs its gaze into the device, some section of the one or more guide light ring comes into view. As the subject further adjusts its gaze toward alignment, more and more of the ring becomes visible until entire ring is visible indicating that alignment has been achieved. During this process, the aspect of the ring that is not visible will direct the subject to adjust its eye in the appropriate direction for alignment. For example, if the right side of the ring is fully visible but the left is not, then the subject adjusts its eye to the right until the light becomes visible.

[013] According to certain embodiments, best shown in FIG 1, the system is external to the ocular imaging device. For example in certain embodiments, the guide lights are positioned on a ring between the objective lens of the camera and the subject's eye. According to certain alternative embodiments, best shown in FIG 2a, the system is integrated into the ocular imaging device. In certain embodiments the guide lights are positioned around the objective lens of the camera. In further embodiments, the guide lights are positioned within the optics of a fundus camera, or other optical device, in the illumination pathway.

[014] According to certain embodiments, best shown in FIG 2b, additional direction is provided to the subject by providing a sequence of lights that serve as sequential focal points. As the subject aligns its eye with each of the sequential focal points, the subjects eye is guided along the z-axis until they are looking at the target ring of light.

[015] In certain embodiments, one or more of the guide lights are implemented as collimated light sources such as laser light. In these embodiments, the one or more guide lights can be direct along a specific path configured to be visible only when the eye is properly positioned. Accordingly, baffles are no longer necessarily needed.

[016] FIG 3 shows exemplary baffles according to certain embodiments. As will be appreciated by one skilled in the art, the angle of the baffle constrains the light emission such that only a beam at the desired beam path angle is emitted, allowing for precise control of the position of the eye required for viewing the masked light.

[017] In certain alternative embodiments, the one or more guide lights are further comprised of sets guide lights, wherein each set is configured to achieve alignment with respect to a specific axis. For example, according to certain embodiments, the plurality of guide lights

are further comprised of one or more of z-axis guide lights, configured to be visible when the subject's eye is optimally positioned along the z-axis with respect to the image sensor. The plurality of guide lights are further comprised of one or more x-axis guide lights and one or more y-axis guide lights, configured to be visible to the subject when the subject is optimally positioned and aligned along the x-axis and y-axis, respectively.

Eye of the Subject

[018] In certain embodiments, proper alignment is achieved when the subject's eye is aligned for imaging of the retina. In further embodiments, proper alignment is achieved when the subject's eye is aligned for imaging the cornea. In still further embodiment, proper alignment is achieved when the subject's eye is aligned for imaging the iris. In yet further embodiments, proper alignment is achieved when the subject's eye is aligned for imaging the lens, In further embodiments, proper alignment is achieved when the subject's eye is aligned for imaging the optic nerve head.

Optical Imaging Device

[019] In certain embodiments, the optical imaging device is a fundus camera. In further embodiments, the camera is an optical coherence tomography (OCT) retinal camera. In still further embodiments, the optical imaging device is autorefractor. In yet further embodiments, the optical imaging device is a corneal camera. As will be appreciated by one skilled in the art, other camera types are possible.

Indicator Signals

[020] According to certain embodiments, the system further comprises one or more indicator signals. In these embodiments, the one or more indicator signal serves to provide additional guidance to the subject regarding the required direction of eye movement to achieve alignment. Example indicator signals include but are not limited arrows, colors, or flashing lights. According to certain embodiments, the indicator signals are masked by one or more baffles such that they are only visible when the eye is out of alignment. For example, a rightward pointing arrow indicator signal is a baffled such that it is only visible to the subject when the subject eye is directed to the left of proper alignment.

[021] According to certain embodiments, best shown in FIG 4, indicator signals are comprised of colored ring lights of differing colors. The one or more guide lights is a color different from the colors of the one or more indicator signal. FIG 4a shows an eye out of alignment where the subject is able to view a yellow indicator signal light but unable to see the green guide light. FIG 4b shows an eye of a subject in proper alignment where the subject is able to see the green guide light but unable to see the yellow or red indicator signals.

[022] Although the present invention has been described with reference to preferred embodiments, persons skilled in the art will recognize that changes may be made in form and detail without departing from the spirit and scope of the invention.

CLAIMS

What is claimed is:

1. An ocular alignment system for aligning a subject's eye with an optical axis of an ocular imaging device comprising:
 - one or more guide light; and
 - one or more baffle configured to mask the one or more guide light from view of the subject such that the one or more guide light is only visible to the subject when the eye of the subject is aligned with the optical axis of an ocular imaging system.
2. The system of claim 1 wherein the one or more guide light is a ring light.
3. The system of claim 1 wherein the one or more guide lights are one or more distinct light sources.
4. The system of claim one wherein the one or more baffle is a cone.
5. The system of claim 1 wherein the one or more guide light is only visible when the eye is aligned along the x, y and z axes with respect to the optical path of the ocular imaging device.
6. The system of claim 1, further comprising one or more indicator signals, wherein the one or more indicator signals indicates to the subject a direction of eye movement to achieve alignment.
7. The system of claim 6 wherein the one or more guide light is only visible when the eye is aligned along the theta, eta, zeta axes with respect to the optical path of the ocular imaging device.
8. The system of claim 5 wherein one or more baffles mask the one or more indicator signal from view of the subject such that the one or more indicator signal is only visible to the subject when the eye of the subject is out of alignment with the optical axis or a target operational distance of the ocular imaging system.
9. The system of claim 6 wherein the one or more indicator signals are arrows.

10. The system of claim 6 wherein the one or more indicator signals are colored lights.
11. The system of claim 1 wherein the system is integrated within optical imaging device.
12. The system of claim 1 wherein the system is external to the optical imaging device.
13. The system of claim 1 further comprising a coaxial light visible to the subject when coarse alignment is achieved.

SYSTEMS AND METHODS FOR ALIGNMENT OF THE EYE FOR OCULAR IMAGING

ABSTRACT

The present invention is an ocular alignment system for aligning a subject's eye with an optical axis of an ocular imaging device comprising one or more guide light and one or more baffle configured to mask the one or more guide light from view of the subject such that the one or more guide light is only visible to the subject when the eye of the subject is aligned with the optical axis of an ocular imaging system.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

Electronic Acknowledgement Receipt

EFS ID:	19483885
Application Number:	62020252
International Application Number:	
Confirmation Number:	9712
Title of Invention:	SYSTEMS AND METHODS FOR ALIGNMENT OF THE EYE FOR OCULAR IMAGING
First Named Inventor/Applicant Name:	Michael Abramoff
Customer Number:	26386
Filer:	Kent A. Herink/Patty Law
Filer Authorized By:	Kent A. Herink
Attorney Docket Number:	8967740-100396
Receipt Date:	02-JUL-2014
Filing Date:	
Time Stamp:	17:51:35
Application Type:	Provisional

Payment information:

Submitted with Payment	yes
Payment Type	Credit Card
Payment was successfully received in RAM	\$130
RAM confirmation Number	4616
Deposit Account	122250
Authorized User	LAW, PATTY

The Director of the USPTO is hereby authorized to charge indicated fees and credit any overpayment as follows:

Charge any Additional Fees required under 37 C.F.R. Section 1.16 (National application filing, search, and examination fees)

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.
