Title: METHODS FOR TREATING ARENAVIRIDAE AND CORONAVIRIDAE VIRUS INFECTIONS

Abstract: Provided are methods for treating Arenaviridae and Coronaviridae virus infections by administering nucleosides and prodrugs thereof, of Formula (I): wherein the 1' position of the nucleoside sugar is substituted. The compounds, compositions, and methods provided are particularly useful for the treatment of Lassa virus and Junin virus infections.

FIELD OF THE INVENTION

[0002] The invention relates generally to methods and compounds for treating *Arenaviridae* virus infections, particularly methods and nucleosides and prodrugs thereof for treating Lassa virus and Junin virus. The invention relates generally to methods and compounds for treating *Coronaviridae* virus infections, particularly methods and nucleosides and prodrugs thereof for treating SARS virus and MERS virus.

BACKGROUND OF THE INVENTION

[0003] Lassa virus is a segmented negative-sense RNA virus that belongs to the family *Arenaviridae*. Arenaviruses are further sub-divided into the Old World and New World virus complexes based on serological cross-reactivity, phylogenetic relations, and geographical distribution, (Wulff, 1978; Bowen, 1997). The New World arenavirus complex comprises viruses that circulate in North America (i.e., Whitewater Arroyo (WWAV), Tamiami (TAMV), and Bear Canyon (BCNV) viruses) and South America (i.e., Tacaribe (TACV), Junin (JUNV), Machupo (MACV), Guanarito (GTOV), and Sabia (SABV) viruses). The Old World complex includes arenaviruses that circulate in Africa, Europe, and Asia (i.e., lymphocytic choreomeningitis (LCMV) and Lassa (LASV) viruses). The range of reservoir rodent species restricts the geographic occurrence of arenaviruses, with the exception of LCMV that is distributed worldwide due to its association with *Mus domesticus* and *M. musculus*, which have migrated globally (Salazar-Bravo, 2002). The reservoir hosts of LASV are rodents of the genus Mastomys that are enzootic in sub-Saharan Africa (Salazar-Bravo, 2002). At least seven arenaviruses are known to cause severe hemorrhagic fever in humans, among which are LASV, JUNV, MACV, GTOV, and SABV that are endemic in West Africa, Argentina, Bolivia, Venezuela, and Brazil, respectively, and recently discovered Lujo
(LUJV) and Chapare (CHAPV) viruses that originated in Zambia and Bolivia, respectively (Breise, 2009; Delgado, 2008).

[0004] Lassa virus (LASV) is endemic to West Africa with an estimated 300,000–500,000 people infected annually (McCormick, 1987). Transmission occurs through contact with infected rodents (Mastomys natalensis) or virus-contaminated rodent excreta, and person-to-person transmission, especially in hospital settings, has been documented (McCormick, 1987). Disease caused by LASV ranges from subclinical infection to mild to severe hemorrhagic fever that is associated with multi-organ failure. Mortality rates associated with LASV infection vary and range from approximately 2% to 15% for hospitalized cases and can exceed 50% in certain outbreak scenarios (McCormick, 1987; Fisher-Hoch, 1995). Despite the high incidence and associated morbidity and mortality, there is no approved therapy to treat LASV infection in humans. Supportive care and early administration of ribavirin are current standard of care.

[0005] LASV initially infects monocytes, macrophages, and dendritic cells and spreads systemically to produce a primary viremia that leads to infection of internal organs. Virus replication leads to a rise in inflammatory cytokine levels and development of coagulopathies resulting in vascular leakage, hypovolemic shock and multi-organ failure (Hensley, 2011).

[0006] Replication of arenaviruses is catalyzed by the L polymerase protein that utilizes viral RNA templates that consist of genomic RNA encapsidated by the viral nucleocapsid protein NP and comprises viral ribonucleoprotein (RNP) (Buchmeier, 2007). Replication is initiated upon viral entry into the host cell where the L polymerase, associated with the viral RNP, initiates transcription from the genome promoter located at the 3’-end of each genomic RNA segment, L and S. The primary transcription event results in the synthesis of NP and L polymerase mRNA encoded in antigenomic orientation from the S and L segments, respectively. Transcription terminates at the distal side of the stem-loop (SL) structure within the intergenic region (IGR). Arenaviruses utilize a cap snatching strategy to acquire the cap structures of cellular mRNAs to facilitate translation. Cap snatching is mediated by the endonuclease activity of the L polymerase that is co-factored by the cap binding activity of NP to produce capped non-polyadenylated mRNAs. Subsequently, the L polymerase adopts a replicase mode and moves across the IGR to generate a full-length complementary antigenomic RNA (agRNA). This agRNA serves as a template for the synthesis of GPC and
Z mRNAs encoded in genomic orientation from the S and L segments, respectively, and for the synthesis of full-length genomic RNA (gRNA) (Buchmeier, 2007; Franze-Fernandez, 1987; Meyer, 1993; Qi, 2010; Lelke, 2010; Morin, 2010).

[0007] Human coronaviruses, first identified in the mid-1960s, are common viruses that infect most people at some time in their life, generally causing mild to moderate upper respiratory and gastrointestinal tract illnesses. The novel coronavirus referred to as "Middle East Respiratory Syndrome Coronavirus" (MERS-CoV or MERS) was first reported in Saudi Arabia in 2012 and has spread to several other countries. SARS-CoV, the coronavirus responsible for Severe Acute Respiratory Syndrome (SARS) was first recognized in China in 2002 and led to a worldwide outbreak in 2002 and 2003.

SUMMARY OF THE INVENTION

[0008] Provided are methods and compounds for the treatment of infections caused by the Arenaviridae virus family.

[0009] Provided is a method for treating an Arenaviridae infection in a human in need thereof comprising administering a therapeutically effective amount of a compound of Formula I:

![Formula I](image)

or a pharmaceutically acceptable salt or ester, thereof;

wherein:

- each R¹ is H or halogen;
- each R², R³, R⁴ or R⁵ is independently H, OR⁶, N(R⁷)₂, N₃, CN, NO₂, S(O)ₙR⁶, halogen, (C₁–C₈)alkyl, (C₄–C₈)carbocyclicalkyl, (C₁–C₈)substituted alkyl,
(C₂₋₃)alkenyl, (C₂₋₃)substituted alkenyl, (C₂₋₃)alkynyl or
(C₂₋₃)substituted alkynyl;

or any two R², R³, R⁴ or R⁵ on adjacent carbon atoms when taken together are
-O(CO)O- or when taken together with the ring carbon atoms to
which they are attached form a double bond;

R⁶ is OR², N(R²)₂, N₃, CN, NO₂, S(O)ₜRN, -C(=O)R¹¹, -C(=O)OR¹¹, -C(=O)NR¹¹R¹²,  
-C(=O)SR¹¹, -S(O)R¹¹, -S(O)₂R¹¹, -S(O)(OR¹¹), -S(O)(OR¹¹), -SO₂NR¹¹R¹²,  
halogen, (C₁₋₈)alkyl, (C₄₋₈)carbocyclicalkyl, (C₁₋₈)substituted alkyl,  
(C₂₋₈)alkenyl, (C₂₋₈)substituted alkenyl, (C₂₋₈)alkynyl,  
(C₂₋₈)substituted alkynyl, or (C₆₋₆₋₂₀)aryl(C₁₋₈)alkyl;

R⁷ is selected from a group consisting of

a) H, -C(=O)R¹¹, -C(=O)OR¹¹, -C(=O)NR¹¹R¹², -C(=O)SR¹¹, -S(O)R¹¹,  
-S(O)₂R¹¹, -S(O)(OR¹¹), -S(O)(OR¹¹), or -SO₂NR¹¹R¹²,

wherein each (C₁₋₈)alkyl, (C₂₋₈)alkenyl, (C₂₋₈)alkynyl or
(C₆₋₆₋₂₀)aryl(C₁₋₈)alkyl of each R¹¹ or R¹² is, independently,
optionally substituted with one or more halo, hydroxy, CN, N₃,  
N(R²)₂ or OR²; and wherein one or more of the non-terminal
carbon atoms of each said (C₁₋₈)alkyl may be optionally
replaced with -O-, -S- or -NR²-.

[0020] In another embodiment, the method comprises administering a therapeutically effective amount of a racemate, enantiomer, diastereomer, tautomer, polymorph, pseudopolymorph, amorphous form, hydrate or solvate of a compound of Formula I or a pharmaceutically acceptable salt or ester thereof to a mammal in need thereof.

[0021] In another embodiment, the method comprises treating a Coronaviridae infection in a human in need thereof by administering a therapeutically effective amount of a compound of Formula I or a pharmaceutically acceptable salt or ester thereof.
[0022] In another embodiment, the method comprises treating a MERS virus infection in a human in need thereof by administering a therapeutically effective amount of a compound of Formula I or a pharmaceutically acceptable salt or ester thereof.

[0023] In another embodiment, the method comprises treating a SARS virus infection in a human in need thereof by administering a therapeutically effective amount of a compound of Formula I or a pharmaceutically acceptable salt or ester thereof.

[0024] In another embodiment, the method of treating a Coronaviridae infection in a human in need thereof comprises administering a therapeutically effective amount of a pharmaceutical composition comprising an effective amount of a Formula I compound, or a pharmaceutically acceptable salt or ester thereof, in combination with a pharmaceutically acceptable diluent or carrier.

[0025] In another embodiment, the method of treating a Coronaviridae infection in a human in need thereof comprises administering a therapeutically effective amount of a pharmaceutical composition comprising an effective amount of a Formula I compound, or a pharmaceutically acceptable salt or ester thereof, in combination with at least one additional therapeutic agent.

[0026] In another embodiment, the method comprises administering a therapeutically effective amount of a combination pharmaceutical agent comprising:

a) a first pharmaceutical composition comprising a compound of Formula I; or a pharmaceutically acceptable salt, solvate, or ester thereof; and

b) a second pharmaceutical composition comprising at least one additional therapeutic agent active against infectious Coronaviridae viruses.

[0027] In another embodiment, the present application provides for a method of inhibiting a Coronaviridae RNA-dependent RNA polymerase, comprising contacting a cell infected with a Coronaviridae virus with an effective amount of a compound of Formula I; or a pharmaceutically acceptable salts, solvate, and/or ester thereof.
In another embodiment, provided is the use of a compound of Formula I or a pharmaceutically acceptable salt, solvate, and/or ester thereof to treat a viral infection caused by a *Coronaviridae* virus.

**DETAILED DESCRIPTION OF THE INVENTION**

I. **DEFINITIONS**

Unless stated otherwise, the following terms and phrases as used herein are intended to have the following meanings:
When trade names are used herein, applicants intend to independently include the trade name product and the active pharmaceutical ingredient(s) of the trade name product.

As used herein, "a compound of the invention" or "a compound of Formula I" means a compound of Formula I or a pharmaceutically acceptable salt, thereof. Similarly, with respect to isolatable intermediates, the phrase "a compound of Formula (number)" means a compound of that formula and pharmaceutically acceptable salts, thereof.

“Alkyl” is hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms. For example, an alkyl group can have 1 to 20 carbon atoms (i.e., C₁-C₂₀ alkyl), 1 to 8 carbon atoms (i.e., C₁-C₈ alkyl), or 1 to 6 carbon atoms (i.e., C₁-C₆ alkyl). Examples of suitable alkyl groups include, but are not limited to, methyl (Me, -CH₃), ethyl (Et, -CH₂CH₃), 1-propyl (n-Pr, n-propyl, -CH₃CH₂CH₃), 2-propyl (i-Pr, i-propyl, -CH(CH₃)₂), 1-butyl (n-Bu, n-butyl, -CH₂CH₂CH₂CH₃), 2-methyl-1-propyl (i-Bu, i-butyl, -CH₂CH(CH₃)₂), 2-butyl (s-Bu, s-butyl, -CH(CH₃)₂CH₂CH₃), 2-methyl-2-propyl (t-Bu, t-butyl, -CH(CH₃)₂CH₂CH₃), 1-pentyl (n-pentyl, -CH₃CH₂CH₂CH₂CH₃), 2-pentyl (-CH(CH₃)CH₂CH₂CH₃), 3-pentyl (-CH(CH₂CH₃)₂), 2-methyl-2-butyl (-C(CH₃)₂CH₂CH₃), 3-methyl-2-butyl (-CH(CH₃)CH(CH₃)₂), 3-methyl-1-butyl (-CH₂CH₂CH(CH₃)₂), 2-methyl-1-butyl (-CH₂CH(CH₃)CH₂CH₃), 1-hexyl (-CH₃CH₂CH₂CH₂CH₂CH₃), 2-hexyl (-CH(CH₃)CH₂CH₂CH₂CH₃), 3-hexyl (-CH(CH₂CH₃)CH₂CH₂CH₃), 2-methyl-2-pentyl (-C(CH₃)₂CH₂CH₂CH₃), 3-methyl-2-pentyl (-CH(CH₃)CH₂CH₂CH₂CH₃), 4-methyl-2-pentyl (-CH(CH₃)CH₂CH₃), 3-methyl-3-pentyl (-CH(CH₃)CH₂CH₂CH₃), 2-methyl-3-pentyl (-CH₂CH₂CH₂CH₂CH₃), 2,3-dimethyl-2-butyl (-C(CH₃)₂CH(CH₃)₂), 3,3-dimethyl-2-butyl (-CH(CH₃)CH₂CH₃, and octyl (-CH₂)₈CH₃).

“Alkoxy” means a group having the formula –O-alkyl, in which an alkyl group, as defined above, is attached to the parent molecule via an oxygen atom. The alkyl portion of an alkoxy group can have 1 to 20 carbon atoms (i.e., C₁-C₂₀ alkoxy), 1 to 12 carbon atoms (i.e., C₁-C₁₂ alkoxy), or 1 to 6 carbon atoms (i.e., C₁-C₆ alkoxy). Examples of suitable alkoxy groups include, but are not limited to, methoxy (-O-CH₃ or -OMe), ethoxy (-OCH₂CH₃ or -OE₆), t-butoxy (-O-C(CH₃)₃ or -OtBu) and the like.

“Haloalkyl” is an alkyl group, as defined above, in which one or more hydrogen atoms of the alkyl group is replaced with a halogen atom. The alkyl portion of a haloalkyl
group can have 1 to 20 carbon atoms (i.e., C1-C20 haloalkyl), 1 to 12 carbon atoms (i.e., C1-C12 haloalkyl), or 1 to 6 carbon atoms (i.e., C1-C6 alkyl). Examples of suitable haloalkyl groups include, but are not limited to, -CF3, -CHF2, -CFH2, -CH2CF3, and the like.

[0042] “Alkenyl” is a hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, i.e. a carbon-carbon, sp2 double bond. For example, an alkenyl group can have 2 to 20 carbon atoms (i.e., C2-C20 alkenyl), 2 to 8 carbon atoms (i.e., C2-C8 alkenyl), or 2 to 6 carbon atoms (i.e., C2-C6 alkenyl). Examples of suitable alkenyl groups include, but are not limited to, ethylene or vinyl (-CH=CH2), allyl (-CH2CH=CH2), cyclopentenyl (-C5H7), and 5-hexenyl (-CH2CH2CH2CH=CH2).

[0043] “Alkynyl” is a hydrocarbon containing normal, secondary, tertiary or cyclic carbon atoms with at least one site of unsaturation, i.e. a carbon-carbon, sp triple bond. For example, an alkynyl group can have 2 to 20 carbon atoms (i.e., C2-C20 alkynyl), 2 to 8 carbon atoms (i.e., C2-C8 alkyne), or 2 to 6 carbon atoms (i.e., C2-C6 alkynyl). Examples of suitable alkynyl groups include, but are not limited to, acetylenic (-C≡CH), propargyl (-CH2C≡CH), and the like.

[0044] “Alkylene” refers to a saturated, branched or straight chain or cyclic hydrocarbon radical having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkane. For example, an alkylene group can have 1 to 20 carbon atoms, 1 to 10 carbon atoms, or 1 to 6 carbon atoms. Typical alkylene radicals include, but are not limited to, methylene (-CH2-), 1,1-ethyl (-CH(CH3)-), 1,2-ethyl (-CH2CH2-), 1,1-propyl (-CH(CH2CH3)-), 1,2-propyl (-CH2CH(CH3)-), 1,3-propyl (-CH2CH2CH2-), 1,4-butyl (-CH2CH2CH2CH2-), and the like.

[0045] “Alkenylene” refers to an unsaturated, branched or straight chain or cyclic hydrocarbon radical having two monovalent radical centers derived by the removal of two hydrogen atoms from the same or two different carbon atoms of a parent alkene. For example, and alkenylene group can have 1 to 20 carbon atoms, 1 to 10 carbon atoms, or 1 to 6 carbon atoms. Typical alkenylene radicals include, but are not limited to, 1,2-ethylene (-CH=CH2).

[0046] “Alkynylene” refers to an unsaturated, branched or straight chain or cyclic hydrocarbon radical having two monovalent radical centers derived by the removal of two
hydrogen atoms from the same or two different carbon atoms of a parent alkyne. For example, an alkyne group can have 1 to 20 carbon atoms, 1 to 10 carbon atoms, or 1 to 6 carbon atoms. Typical alkyne radicals include, but are not limited to, acetylene (-C≡C-), propargyl (-CH₂C≡C-), and 4-pentylnyl (-CH₂CH₂CH₂C≡C-).

[0047] “Amino” refers generally to a nitrogen radical which can be considered a derivative of ammonia, having the formula –N(X)₂, where each “X” is independently H, substituted or unsubstiuted alkyl, substituted or unsubstituted carbocyclic, substituted or unsubstituted heterocyclic, etc. The hybridization of the nitrogen is approximately sp³. Nonlimiting types of amino include –NH₂, -N(alkyl)₂, -NH(alkyl), -N(carbocyclic)₂, -NH(carbocyclic), -N(heterocyclic)₂, -NH(heterocyclic), -N(aryl)₂, -NH(aryl), -N(alkyl)(aryl), -N(ary)(heterocyclyl), -N(heteroaryl), etc. The term “alkylamino” refers to an amino group substituted with at least one alkyl group. Nonlimiting examples of amino groups include –NH₂, -NH(CH₃), -N(CH₃)₂, -NH(CH₂CH₃), -N(CH₂CH₃)₂, -NH(phenyl), -N(phenyl)₂, -NH(benzyl), -N(benzyl)₂, etc. Substituted alkylamino refers generally to alkylamino groups, as defined above, in which at least one substituted alkyl, as defined herein, is attached to the amino nitrogen atom. Non-limiting examples of substituted alkylamino includes -NH(alkylene-C(O)-OH), -NH(alkylene-C(O)-O-alkyl), -N(alkylene-C(O)-OH)₂, -N(alkylene-C(O)-O-alkyl)₂, etc.

[0048] “Aryl” means an aromatic hydrocarbon radical derived by the removal of one hydrogen atom from a single carbon atom of a parent aromatic ring system. For example, an aryl group can have 6 to 20 carbon atoms, 6 to 14 carbon atoms, or 6 to 10 carbon atoms. Typical aryl groups include, but are not limited to, radicals derived from benzene (e.g., phenyl), substituted benzene, naphthalene, anthracene, biphenyl, and the like.

[0049] “Arylalkyl” refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp³ carbon atom, is replaced with an aryl radical. Typical arylalkyl groups include, but are not limited to, benzyl, 2-phenylethan-1-yl, naphthylmethyl, 2-naphthylethan-1-yl, naphthobenzyl, 2-naphthophenylethan-1-yl and the like. The arylalkyl group can comprise 7 to 20 carbon atoms, e.g., the aryl moiety is 1 to 6 carbon atoms and the aryl moiety is 6 to 14 carbon atoms.
“Arylalkenyl” refers to an acyclic alkenyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or $sp^3$ carbon atom, but also an $sp^3$ carbon atom, is replaced with an aryl radical. The aryl portion of the arylalkenyl can include, for example, any of the aryl groups disclosed herein, and the alkenyl portion of the arylalkenyl can include, for example, any of the alkenyl groups disclosed herein. The arylalkenyl group can comprise 8 to 20 carbon atoms, e.g., the alkenyl moiety is 2 to 6 carbon atoms and the aryl moiety is 6 to 14 carbon atoms.

“Arylalkynyl” refers to an acyclic alkynyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or $sp^3$ carbon atom, but also an $sp$ carbon atom, is replaced with an aryl radical. The aryl portion of the arylalkynyl can include, for example, any of the aryl groups disclosed herein, and the alkynyl portion of the arylalkynyl can include, for example, any of the alkynyl groups disclosed herein. The arylalkynyl group can comprise 8 to 20 carbon atoms, e.g., the alkynyl moiety is 2 to 6 carbon atoms and the aryl moiety is 6 to 14 carbon atoms.

The term “substituted” in reference to alkyl, alkyne, aryl, arylalkyl, alkoxy, heterocyclyl, heteroaryl, carbocyclyl, etc., for example, “substituted alkyl”, “substituted alkyne”, “substituted aryl”, “substituted arylalkyl”, “substituted heterocyclyl”, and “substituted carbocyclyl” means alkyl, alkyne, aryl, arylalkyl, heterocyclyl, carbocyclyl respectively, in which one or more hydrogen atoms are each independently replaced with a non-hydrogen substituent. Typical substituents include, but are not limited to, -X, -R<sup>b</sup>, -O-, =O, -OR<sup>b</sup>, -SR<sup>b</sup>, -S-, -NR<sub>b</sub>, -N<sup>+</sup>R<sub>b</sub>, =NR<sub>b</sub>, -CN, -OCN, -SCN, -N=O, -N=CS, -NO, -NO<sub>2</sub>, =N=O, -NR<sub>b</sub>, -NHC(=O)R<sup>b</sup>, -OC(=O)R<sup>b</sup>, -NHC(=O)NR<sub>b</sub>, -S(=O)<sub>b</sub>, -S(=O)=O, -S(=O)=S, -S(=O)=NR<sub>b</sub>, -S(=O)R<sup>b</sup>, -OP(=O)(OR)<sub>b</sub>, -P(O)(OR)<sub>b</sub>, -P(O)(OR)<sub>b</sub>, -P(=O)(OR)<sub>b</sub>, -P(=O)(OR)<sub>b</sub>, -P(=O)(OR)<sub>b</sub>, -P(=O)(OR)<sub>b</sub>, -P(O)(OR)<sub>b</sub>, -C(=O)=O, -C=O, -C(=O)X, -C(=O)NR<sub>b</sub>, -C(=O)OR<sub>b</sub>, -C(=O)OR<sub>b</sub>, -C(=O)OR<sub>b</sub>, -C(=O)OR<sub>b</sub>, -C(=O)OR<sub>b</sub>, -C(=O)OR<sub>b</sub>, where each X is independently a halogen: F, Cl, Br, or I; and each R<sup>b</sup> is independently H, alkyl, aryl, arylalkyl, a heterocycle, or a protecting group or prodrug moiety. Alkylene, alkenylene, and alkynylene groups may also be similarly substituted. Unless otherwise indicated, when the term "substituted" is used in conjunction with groups such as arylalkyl, which have two or more moieties capable of substitution, the substituents can be attached to the aryl moiety, the alkyl moiety, or both.
[0053] A “prodrug” is defined in the pharmaceutical field as a biologically inactive derivative of a drug that upon administration to the human body is converted to the biologically active parent drug according to some chemical or enzymatic pathway.

[0054] One skilled in the art will recognize that substituents and other moieties of the compounds of Formula I-IV should be selected in order to provide a compound which is sufficiently stable to provide a pharmaceutically useful compound which can be formulated into an acceptably stable pharmaceutical composition. Compounds of Formula I-IV which have such stability are contemplated as falling within the scope of the present invention.

[0055] “Heteroalkyl” refers to an alkyl group where one or more carbon atoms have been replaced with a heteroatom, such as, O, N, or S. For example, if the carbon atom of the alkyl group which is attached to the parent molecule is replaced with a heteroatom (e.g., O, N, or S) the resulting heteroalkyl groups are, respectively, an alkoxy group (e.g., -OCH₃, etc.), an amine (e.g., -NHCH₃, -N(CH₃)₂, etc.), or a thioalkyl group (e.g., -SCH₃). If a non-terminal carbon atom of the alkyl group which is not attached to the parent molecule is replaced with a heteroatom (e.g., O, N, or S) the resulting heteroalkyl groups are, respectively, an alkyl ether (e.g., -CH₂CH₂-O-CH₃, etc.), an alkyl amine (e.g., -CH₂NHCH₃, -CH₂N(CH₃)₂, etc.), or a thioalkyl ether (e.g., -CH₂-S-CH₃). If a terminal carbon atom of the alkyl group is replaced with a heteroatom (e.g., O, N, or S), the resulting heteroalkyl groups are, respectively, a hydroxyalkyl group (e.g., -CH₂CH₂-OH), an aminoalkyl group (e.g., -CH₂NH₂), or an alkyl thiol group (e.g., -CH₂CH₂-SH). A heteroalkyl group can have, for example, 1 to 20 carbon atoms, 1 to 10 carbon atoms, or 1 to 6 carbon atoms. A C₁-C₆ heteroalkyl group means a heteroalkyl group having 1 to 6 carbon atoms.

[0056] “Heterocycle” or “heterocyclic” as used herein includes by way of example and not limitation those heterocycles described in Paquette, Leo A.; Principles of Modern Heterocyclic Chemistry (W.A. Benjamin, New York, 1968), particularly Chapters 1, 3, 4, 6, 7, and 9; The Chemistry of Heterocyclic Compounds, A Series of Monographs” (John Wiley & Sons, New York, 1950 to present), in particular Volumes 13, 14, 16, 19, and 28; and J. Am. Chem. Soc. (1960) 82:5566. In one specific embodiment of the invention “heterocycle” includes a “carbocycle” as defined herein, wherein one or more (e.g. 1, 2, 3, or 4) carbon atoms have been replaced with a heteroatom (e.g. O, N, or S). The terms “heterocycle” or “heterocyclic” includes saturated rings, partially unsaturated rings, and aromatic rings (i.e.,
heteroaromatic rings). Substituted heterocycllys include, for example, heterocyclic rings substituted with any of the substituents disclosed herein including carbonyl groups. A non-limiting example of a carbonyl substituted heterocyclyl is:

\[
\begin{align*}
\text{N} & \quad \text{O} \\
\text{O} & \quad \text{NH}
\end{align*}
\]

[0057] Examples of heterocycles include by way of example and not limitation pyridyl, dihydropyridyl, tetrahydropyridyl (piperidyl), thiazolyl, tetrahydrothiophenyl, sulfur oxidized tetrahydrothiophenyl, pyrimidinyl, furanyl, thietyl, pyrrolyl, pyrazolyl, imidazolyl, tetrazolyl, benzofuranyl, thianaphthalenyl, indolyl, indolenyl, quinolinyl, isoquinolinyl, benzimidazolyl, piperidinyl, 4-piperidonyl, pyrrolidinyl, 2-pyrrolidonyl, pyrrolyl, tetrahydrofuranyl, tetrahydroquinolyl, tetrahydroisoquinolyl, decahydroquinolyl, octahydroisoquinolyl, azocinyl, triazinyl, 6H-1,2,5-thiadiazinyl, 2H,6H-1,5,2-dithiazinyl, thienyl, thianthrenyl, pyranyl, isobenzofuranyl, chromenyl, xanthenyl, phenoxathinyl, 2H-pyrrolyl, isothiazolyl, isoxazolyl, pyrazinyl, pyridazinyl, indoliziny1, isoindolyl, 3H-indolyl, 1H-indazolyl, purinyl, 4H-triazinyl, phthalazinyl, naphthyridinyl, quinoxaliny1, quinazoliny1, cinnolinyl, pteridinyl, 4aH-carbazolyl, carbazolyl, β-carboliny1, phenanthridiny1, acridinyl, pyrimidinyl, phenanthroliny1, phenazinyl, phenothiazinyl, furazanyl, phenoxazinyl, isochromanyl, chromanyl, imidazolidinyl, imidazoliny1, pyrazolidinyl, pyrazoliny1, piperaziny1, indoliny1, isoindoliny1, quinclidiny1, morpholiny1, oxazolidinyl, benzotriazolyl, benzisoxazolyl, oxindolyl, benzoxazoliny1, isatinoyl, and bis-tetrahydrofuranyl:

\[
\begin{align*}
\text{O} & \quad \text{O} \\
\text{O} & \quad \text{O}
\end{align*}
\]

[0058] By way of example and not limitation, carbon bonded heterocycles are bonded at position 2, 3, 4, 5, or 6 of a pyridine, position 3, 4, 5, or 6 of a pyrazidine, position 2, 4, 5, or 6 of a pyrimidine, position 2, 3, 5, or 6 of a pyrazine, position 2, 3, 4, or 5 of a furan, tetrahydrofurany1, thiofuran, thiophene, pyrrole or tetrahydropyrrole, position 2, 4, or 5 of an oxazole, imidazole or thiazole, position 3, 4, or 5 of an isoxazole, pyrazole, or isothiazole,
position 2 or 3 of an aziridine, position 2, 3, or 4 of an azetidine, position 2, 3, 4, 5, 6, 7, or 8 of a quinoline or position 1, 3, 4, 5, 6, 7, or 8 of an isoquinoline. Still more typically, carbon bonded heterocycles include 2-pyridyl, 3-pyridyl, 4-pyridyl, 5-pyridyl, 6-pyridyl, 3-pyridazinyl, 4-pyridazinyl, 5-pyridazinyl, 6-pyridazinyl, 2-pyrimidinyl, 4-pyrimidinyl, 5-pyrimidinyl, 6-pyrimidinyl, 2-pyrazinyl, 3-pyrazinyl, 5-pyrazinyl, 6-pyrazinyl, 2-thiazolyl, 4-thiazolyl, or 5-thiazolyl.

[0059] By way of example and not limitation, nitrogen bonded heterocycles are bonded at position 1 of an aziridine, azetidine, pyrrole, pyrrolidine, 2-pyrrole, 3-pyrrole, imidazole, imidazolidine, 2-imidazoline, 3-imidazoline, pyrazole, pyrazoline, pyrazoline, 3-pyrazolone, piperidine, piperazine, indole, indoline, 1H-indazole, position 2 of a isoindole, or isoindoline, position 4 of a morpholine, and position 9 of a carbazole, or β-carboline. Still more typically, nitrogen bonded heterocycles include 1-aziridyl, 1-azetidyl, 1-pyrrolyl, 1imidazolyl, 1-pyrazolyl, and 1-piperidinyl.

[0060] “Heterocyclicalkyl” refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp³ carbon atom, is replaced with a heterocyclic radical (i.e., a heterocyclic-alkylene-moiety). Typical heterocyclic alkyl groups include, but are not limited to heterocyclic-CH₂-, 2-(heterocyclic)ethan-1-yl, and the like, wherein the “heterocyclic” portion includes any of the heterocyclic groups described above, including those described in Principles of Modern Heterocyclic Chemistry. One skilled in the art will also understand that the heterocyclic group can be attached to the alkyl portion of the heterocyclic alkyl by means of a carbon-carbon bond or a carbon-heteroatom bond, with the proviso that the resulting group is chemically stable. The heterocyclic alkyl group comprises 3 to 20 carbon atoms, e.g., the alkyl portion of the aryalkyl group is 1 to 6 carbon atoms and the heterocyclic moiety is 2 to 14 carbon atoms. Examples of heterocyclicalkyls include by way of example and not limitation 5-membered sulfur, oxygen, and/or nitrogen containing heterocycles such as thiazolylmethyl, 2-thiazolethanol-1-yl, imidazolylmethyl, oxazolylmethyl, thiadiazolylmethyl, etc., 6-membered sulfur, oxygen, and/or nitrogen containing heterocycles such as piperidinylmethyl, piperazinylmethyl, morpholinylmethyl, pyridinylmethyl, pyridazinylmethyl, pyrimidinylmethyl, pyrazinylmethyl, etc.

[0061] “Heterocyclicalkenyl” refers to an acyclic alkenyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp³ carbon atom, but also a
sp\(^2\) carbon atom, is replaced with a heterocyclyl radical (i.e., a heterocyclyl-alkenylene-moiety). The heterocyclyl portion of the heterocyclyl alkenyl group includes any of the heterocyclyl groups described herein, including those described in *Principles of Modern Heterocyclic Chemistry*, and the alkenyl portion of the heterocyclyl alkenyl group includes any of the alkenyl groups disclosed herein. One skilled in the art will also understand that the heterocyclyl group can be attached to the alkenyl portion of the heterocyclyl alkenyl by means of a carbon-carbon bond or a carbon-heteroatom bond, with the proviso that the resulting group is chemically stable. The heterocyclyl alkenyl group comprises 4 to 20 carbon atoms, *e.g.*, the alkenyl portion of the heterocyclyl alkenyl group is 2 to 6 carbon atoms and the heterocyclyl moiety is 2 to 14 carbon atoms.

[0062] “Heterocyclylalkynyl” refers to an acyclic alkynyl radical in which one of the hydrogen atoms bonded to a carbon atom, typically a terminal or sp\(^3\) carbon atom, but also an sp carbon atom, is replaced with a heterocyclyl radical (i.e., a heterocyclyl-alkynylene-moiety). The heterocyclyl portion of the heterocyclyl alkynyl group includes any of the heterocyclyl groups described herein, including those described in *Principles of Modern Heterocyclic Chemistry*, and the alkynyl portion of the heterocyclyl alkynyl group includes any of the alkynyl groups disclosed herein. One skilled in the art will also understand that the heterocyclyl group can be attached to the alkynyl portion of the heterocyclyl alkynyl by means of a carbon-carbon bond or a carbon-heteroatom bond, with the proviso that the resulting group is chemically stable. The heterocyclyl alkynyl group comprises 4 to 20 carbon atoms, *e.g.*, the alkynyl portion of the heterocyclyl alkynyl group is 2 to 6 carbon atoms and the heterocyclyl moiety is 2 to 14 carbon atoms.

[0063] “Heteroaryl” refers to an aromatic heterocyclyl having at least one heteroatom in the ring. Non-limiting examples of suitable heteroatoms which can be included in the aromatic ring include oxygen, sulfur, and nitrogen. Non-limiting examples of heteroaryl rings include all of those aromatic rings listed in the definition of “heterocyclyl”, including pyridinyl, pyrrolyl, oxazolyl, indolyl, isoindolyl, purinyl, furanyl, thiienyl, benzofuranyl, benzo thiophenyl, carbazolyl, imidazolyl, thiazolyl, isoxazolyl, pyrazolyl, isothiazolyl, quinolyl, isoquinolyl, pyridazyl, pyrimidyl, pyrazyl, etc.

[0064] “Carbocycle” or “carbo cyclyl” refers to a saturated (i.e., cycloalkyl), partially unsaturated (e.g., cycloalkenyl, cycloalkadienyl, etc.) or aromatic ring having 3 to 7 carbon
atoms as a monocycle, 7 to 12 carbon atoms as a bicycle, and up to about 20 carbon atoms as a polycycle. Monocyclic carbocycles have 3 to 7 ring atoms, still more typically 5 or 6 ring atoms. Bicyclic carbocycles have 7 to 12 ring atoms, e.g., arranged as a bicyclo [4,5], [5,5], [5,6] or [6,6] system, or 9 or 10 ring atoms arranged as a bicyclo [5,6] or [6,6] system, or spiro-fused rings. Non-limiting examples of monocyclic carbocycles include cyclopropyl, cyclobutyl, cyclopentyl, 1-cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-2-enyl, 1-cyclohex-3-enyl, and phenyl. Non-limiting examples of bicyclo carbocycles includes napthyl, tetrahydronaphthalene, and decaline.

[0065] “Carbocyclylalkyl” refers to an acyclic alkyl radical in which one of the hydrogen atoms bonded to a carbon atom is replaced with a carbocyclyl radical as described herein. Typical, but non-limiting, examples of carbocyclylalkyl groups include cyclopropylmethyl, cyclopropylethyl, cyclobutylmethyl, cyclopentylmethyl and cyclohexylmethyl.

[0066] “Arylheteroalkyl” refers to a heteroalkyl as defined herein, in which a hydrogen atom (which may be attached either to a carbon atom or a heteroatom) has been replaced with an aryl group as defined herein. The aryl groups may be bonded to a carbon atom of the heteroalkyl group, or to a heteroatom of the heteroalkyl group, provided that the resulting arylheteroalkyl group provides a chemically stable moiety. For example, an arylheteroalkyl group can have the general formulae -alkylene-O-aryl, -alkylene-O-alkylene-aryl, -alkylene-NH-aryl, -alkylene-NH-alkylene-aryl, -alkylene-S-aryl, -alkylene-S-alkylene-aryl, etc. In addition, any of the alkylene moieties in the general formulae above can be further substituted with any of the substituents defined or exemplified herein.

[0067] “Heteroarylalkyl” refers to an alkyl group, as defined herein, in which a hydrogen atom has been replaced with a heteroaryl group as defined herein. Non-limiting examples of heteroaryl alkyl include -CH₂-pyridinyl, -CH₂-pyrrolyl, -CH₂-oxazolyl, -CH₂-indolyl, -CH₂-isoindolyl, -CH₂-purinyl, -CH₂-furanyl, -CH₂-thienyl, -CH₂-benzofuranyl, -CH₂-benzothiophenyl, -CH₂-carbazolyl, -CH₂-imidazolyl, -CH₂-thiazolyl, -CH₂-isoxazolyl, -CH₂-pyrazolyl, -CH₂-isothiazolyl, -CH₂-quinolyl, -CH₂-isoquinolyl, -CH₂-pyridazyl, -CH₂-pyrimidyl, -CH₂-pyrazyl, -CH(CH₃)-pyridinyl, -CH(CH₃)-pyrrolyl, -CH(CH₃)-oxazolyl, -CH(CH₃)-indolyl, -CH(CH₃)-isoindolyl, -CH(CH₃)-purinyl, -CH(CH₃)-furanyl, -CH(CH₃)-thienyl, -CH(CH₃)-benzofuranyl, -CH(CH₃)-benzothiophenyl,
-CH(CH₃)-carbazolyl, -CH(CH₃)-imidazolyl, -CH(CH₃)-thiazolyl, -CH(CH₃)-isoazolyl, -CH(CH₃)-pyrazolyl, -CH(CH₃)-isothiazolyl, -CH(CH₃)-quinolyl, -CH(CH₃)-isoquinolyl, -CH(CH₃)-pyridazyl, -CH(CH₃)-pyrimidyl, -CH(CH₃)-pyrazyl, etc.

[0068] The term “optionally substituted” in reference to a particular moiety of the compound of Formula I-IV (e.g., an optionally substituted aryl group) refers to a moiety wherein all substituents are hydrogen or wherein one or more of the hydrogens of the moiety may be replaced by substituents such as those listed under the definition of “substituted”.

[0069] The term “optionally replaced” in reference to a particular moiety of the compound of Formula I-IV (e.g., the carbon atoms of said (C₁-C₈)alkyl may be optionally replaced by –O-, –S-, or –NR₃-) means that one or more of the methylene groups of the (C₁-C₈)alkyl may be replaced by 0, 1, 2, or more of the groups specified (e.g., –O-, –S-, or –NR₃-).

[0070] The term “non-terminal carbon atom(s)” in reference to an alkyl, alkenyl, alkynyl, alkyne, alkenylene, or alkynylene moiety refers to the carbon atoms in the moiety that intervene between the first carbon atom of the moiety and the last carbon atom in the moiety. Therefore, by way of example and not limitation, in the alkyl moiety -CH₂(C')H₂(C')H₂CH₃ or alkylene moiety -CH₂(C')H₂(C')H₂CH₂- the C' atoms would be considered to be the non-terminal carbon atoms.

[0071] Certain Q and Q₁ alternatives are nitrogen oxides such as ™N(O)(R) or ™N(O)(OR). These nitrogen oxides, as shown here attached to a carbon atom, can also be represented by charge separated groups such as

$$\begin{array}{c}
\text{N}^+ \text{R} \quad \text{O}^- \\
\text{N}^+ \text{OR} \quad \text{O}^- 
\end{array}$$

respectively, and are intended to be equivalent to the aforementioned representations for the purposes of describing this invention.

[0072] "Linker" or “link” means a chemical moiety comprising a covalent bond or a chain of atoms. Linkers include repeating units of alkylolxy (e.g. polyethyleneoxy, PEG, polymethyleneoxy) and alkylamino (e.g. polyethyleneamino, Jeffamine™); and diacid ester and amides including succinate, succinamide, diglycolate, malonate, and caproamide.
[0073] The terms such as “oxygen-linked”, “nitrogen-linked”, “carbon-linked”, “sulfur-linked”, or “phosphorous-linked” mean that if a bond between two moieties can be formed by using more than one type of atom in a moiety, then the bond formed between the moieties is through the atom specified. For example, a nitrogen-linked amino acid would be bonded through a nitrogen atom of the amino acid rather than through an oxygen or carbon atom of the amino acid.

[0074] In some embodiments of the compounds of Formula I-IV, one or more of Z¹ or Z² are independently a radical of a nitrogen-linked naturally occurring α-amino acid ester. Examples of naturally occurring amino acids include isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan, valine, alanine, asparagine, aspartic acid, cysteine, glutamic acid, glutamine, glycine, proline, selenocysteine, serine, tyrosine, arginine, histidine, ornithine and taurine. The esters of these amino acids comprise any of those described for the substituent R, particularly those in which R is optionally substituted (C₁-C₈)alkyl.

[0075] The term “purine” or “pyrimidine” base comprises, but is not limited to, adenine, N⁶-alkylpurines, N⁶-acylpurines (wherein acyl is C(O)(alkyl, aryl, alkylaryl, or arylalkyl), N⁶-benzylpurine, N⁶-halopurine, N⁶-vinylpurine, N⁶-acetylenic purine, N⁶-acyl purine, N⁶-hydroxyalkyl purine, N⁶-allylaminopurine, N⁶-thioallyl purine, N²-alkylpurines, N²-alkyl-6-thiopurines, thymine, cytosine, 5-fluorocytosine, 5-methylcytosine, 6-azapyrimidine, including 6-azacytosine, 2- and/or 4-mercaptopurine, uracil, 5-halouracil, including 5-fluouracil, C⁵-alkylpyrimidines, C⁵-benzylpyrimidines, C⁵-halopyrimidines, C⁵-vinylpyrimidine, C⁵-acetylenic pyrimidine, C⁵-acyl pyrimidine, C⁵-hydroxyalkyl purine, C⁵-amidopyrimidine, C⁵-cyanopyrimidine, C⁵-5-iodopyrimidine, C⁵-iodo-pyrimidine, C⁵-Br-vinyl pyrimidine, C⁵-Br-vinyl pyrimidine, C⁵-nitropyrimidine, C⁵-amino-pyrimidine, N²-alkylpurines, N²-alkyl-6-thiopurines, 5-azacytidinyl, 5-azauracilyl, triazolopyridinyl, imidazolopyridinyl, pyrrolopyrimidinyl, and pyrazolopyrimidinyl. Purine bases include, but are not limited to, guanine, adenine, hypoxanthine, 2,6-diaminopurine, and 6-chloropurine. The purine and pyrimidine bases of Formula I-III are linked to the ribose sugar, or analog thereof, through a nitrogen atom of the base. Functional oxygen and nitrogen groups on the base can be protected as necessary or desired. Suitable protecting groups are well known to those skilled in the art, and include trimethylsilyl, dimethylhexylsilyl, t-butyldimethylsilyl, and t-butyldiphenylsilyl, trityl, alkyl groups, and acyl groups such as acetyl and propionyl, methanesulfonyl, and p-toluenesulfonyl.
[0076] Unless otherwise specified, the carbon atoms of the compounds of Formula I-IV are intended to have a valence of four. In some chemical structure representations where carbon atoms do not have a sufficient number of variables attached to produce a valence of four, the remaining carbon substituents needed to provide a valence of four should be assumed to be hydrogen. For example,

![Chemical Structure 1](image1)

has the same meaning as

![Chemical Structure 2](image2)

[0077] "Protecting group" refers to a moiety of a compound that masks or alters the properties of a functional group or the properties of the compound as a whole. The chemical substructure of a protecting group varies widely. One function of a protecting group is to serve as an intermediate in the synthesis of the parental drug substance. Chemical protecting groups and strategies for protection/deprotection are well known in the art. See: "Protective Groups in Organic Chemistry", Theodora W. Greene (John Wiley & Sons, Inc., New York, 1991). Protecting groups are often utilized to mask the reactivity of certain functional groups, to assist in the efficiency of desired chemical reactions, e.g. making and breaking chemical bonds in an ordered and planned fashion. Protection of functional groups of a compound alters other physical properties besides the reactivity of the protected functional group, such as the polarity, lipophilicity (hydrophobicity), and other properties which can be measured by
common analytical tools. Chemically protected intermediates may themselves be biologically active or inactive. “Hydroxy protecting groups” refers to those protecting groups useful for protecting hydroxy groups (-OH).

[0078] Protected compounds may also exhibit altered, and in some cases, optimized properties in vitro and in vivo, such as passage through cellular membranes and resistance to enzymatic degradation or sequestration. In this role, protected compounds with intended therapeutic effects may be referred to as prodrugs. Another function of a protecting group is to convert the parental drug into a prodrug, whereby the parental drug is released upon conversion of the prodrug in vivo. Because active prodrugs may be absorbed more effectively than the parental drug, prodrugs may possess greater potency in vivo than the parental drug. Protecting groups are removed either in vitro, in the instance of chemical intermediates, or in vivo, in the case of prodrugs. With chemical intermediates, it is not particularly important that the resulting products after deprotection, e.g. alcohols, be physiologically acceptable, although in general it is more desirable if the products are pharmacologically innocuous.

[0079] The term "chiral" refers to molecules which have the property of non-superimposability of the mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner.

[0080] The term "stereoisomers" refers to compounds which have identical chemical constitution, but differ with regard to the arrangement of the atoms or groups in space.

[0081] "Diastereomer" refers to a stereoisomer with two or more centers of chirality and whose molecules are not mirror images of one another. Diastereomers have different physical properties, e.g. melting points, boiling points, spectral properties, reactivities and biological properties. For example, the compounds of Formula I-IV may have a chiral phosphorus atom when R^2 is

![Diagram]

and Z^1 and Z^2 are different. When at least one of either Z^1 or Z^2 also has a chiral center, for example with Z^1 or Z^2 is a nitrogen-linked, chiral, naturally occurring α-amino acid ester, then the compound of Formula I-IV will exists as diastereomers because there are two centers
of chirality in the molecule. All such diastereomers and their uses described herein are encompassed by the instant invention. Mixtures of diastereomers may be separate under high resolution analytical procedures such as electrophoresis, crystallization and/or chromatography. Diastereomers may have different physical attributes such as, but not limited to, solubility, chemical stabilities and crystallinity and may also have different biological properties such as, but not limited to, enzymatic stability, absorption and metabolic stability.

[0082] "Enantiomers" refer to two stereoisomers of a compound which are non-superimposable mirror images of one another.

[0083] The modifier "about" used in connection with a quantity is inclusive of the stated value and has the meaning dictated by the context (e.g., includes the degree of error associated with measurement of the particular quantity).

[0084] The term “treating”, as used herein, unless otherwise indicated, means reversing, alleviating, inhibiting the progress of, or preventing the disorder or condition to which such term applies, or one or more symptoms of such disorder or condition. The term “treatment”, as used herein, refers to the act of treating, as “treating” is defined immediately above.

[0085] The term “therapeutically effective amount”, as used herein, is the amount of compound of Formula I-IV present in a composition described herein that is needed to provide a desired level of drug in the secretions and tissues of the airways and lungs, or alternatively, in the bloodstream of a subject to be treated to give an anticipated physiological response or desired biological effect when such a composition is administered by the chosen route of administration. The precise amount will depend upon numerous factors, for example the particular compound of Formula I-IV, the specific activity of the composition, the delivery device employed, the physical characteristics of the composition, its intended use, as well as patient considerations such as severity of the disease state, patient cooperation, etc., and can readily be determined by one skilled in the art based upon the information provided herein.

[0086] The term “normal saline” means a water solution containing 0.9% (w/v) NaCl.

[0087] The term “hypertonic saline” means a water solution containing greater than 0.9% (w/v) NaCl. For example, 3% hypertonic saline would contain 3% (w/v) NaCl.
“Forming a reaction mixture” refers to the process of bringing into contact at least two distinct species such that they mix together and can react. It should be appreciated, however, the resulting reaction product can be produced directly from a reaction between the added reagents or from an intermediate from one or more of the added reagents which can be produced in the reaction mixture.

“Coupling agent” refers to an agent capable of coupling two disparate compounds. Coupling agents can be catalytic or stoichiometric. For example, the coupling agents can be a lithium based coupling agent or a magnesium based coupling agent such as a Grignard reagent. Exemplary coupling agents include, but are not limited to, n-BuLi, MgCl₂, iPrMgCl, tBuMgCl, PhMgCl or combinations thereof.

“Silane” refers to a silicon containing group having the formula SiR₄, where each R group can be alkyl, alkenyl, cycloalkyl, phenyl, or other silicon containing groups. When the silane is linked to another compound, the silane is referred to as a “silyl” and has the formula -SiR₃.

“Halo-silane” refers to a silane having at least one halogen group linked to the silicon atom. Representative halo-silanes have the formula Halo-SiR₃, where each R group can be alkyl, alkenyl, cycloalkyl, phenyl, or other silicon containing groups. Specific halo-silanes include Cl-Si(CH₃)₃, and Cl-Si(CH₃)₂CH₂CH₂Si(CH₃)₂-Cl.

“Non-nucleophilic base” refers to an electron donor, a Lewis base, such as nitrogen bases including triethylamine, diisopropylethyl amine, N,N-diethylaniline, pyridine, 2,6-lutidine, 2,4,6-collidine, 4-dimethylaminopyridine, and quinuclidine.

“Leaving group” refers to groups that maintain the bonding electron pair during heterolytic bond cleavage. For example, a leaving group is readily displaced during a nucleophilic displacement reaction. Suitable leaving groups include, but are not limited to, chloride, bromide, mesylate, tosylate, triflate, 4-nitrobenzenesulfonate, 4-chlorobenzenesulfonate, 4-nitrophenoxyl, pentafluorophenoxyl, etc. One of skill in the art will recognize other leaving groups useful in the present invention.

“Deprotection agent” refers to any agent capable of removing a protecting group. The deprotection agent will depend on the type of protecting group used. Representative deprotection agents are known in the art and can be found in Protective Groups in Organic Chemistry, Peter G. M. Wuts and Theodora W. Greene, 4th Ed., 2006.
II. COMPOUNDS OF THE PRESENT INVENTION

[0095] Reference will now be made in detail to certain embodiments of the invention, examples of which are illustrated in the accompanying description, structures and formulas. While the invention will be described in conjunction with the enumerated embodiments, it will be understood that they are not intended to limit the invention to those embodiments. On the contrary, the invention is intended to cover all alternatives, modifications, and equivalents, which may be included within the scope of the present invention.

[0096] Provided is a method for treating an Arenaviridae infection in a human in need thereof comprising administering a therapeutically effective amount of a compound of Formula I:

\[
\begin{align*}
& R^7 \quad R^8 \\
& R^5 \quad R^6 \\
& R^2 \quad R^3 \\
& R^1 \quad R^9 \\
& R^10
\end{align*}
\]

or a pharmaceutically acceptable salt or ester, thereof;

wherein:

- each R^1 is H or halogen;

- each R^2, R^3, R^4 or R^5 is independently H, OR^a, N(R^a)_2, N_3, CN, NO_2, S(O)_{n}R^a, halogen, (C_1–C_8)alkyl, (C_4–C_8)carbocyclyalkyl, (C_1–C_8)substituted alkyl, (C_2–C_8)alkenyl, (C_2–C_8)substituted alkenyl, (C_2–C_8)alkynyl or (C_2–C_8)substituted alkynyl;

- or any two R^2, R^3, R^4 or R^5 on adjacent carbon atoms when taken together are -O(CO)O- or when taken together with the ring carbon atoms to which they are attached form a double bond;

- R^6 is OR^a, N(R^a)_2, N_3, CN, NO_2, S(O)_{n}R^a, -C(=O)R^{11}, -C(=O)OR^{11}, -C(=O)NR^{11}R^{12}, -C(=O)SR^{11}, -S(O)R^{11}, -S(O)_{2}R^{11}, -S(O)(OR^{11}), -S(O)_{2}(OR^{11}), -SO_{2}NR^{11}R^{12}.

which is named (S)-2-ethylbutyl 2-(((R)-((2R,3S,4R,5R)-5-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxytetrahydrofuran-2-yl)methoxy)(phenoxy)phosphoryl)amino)propanoate.

[0166] Any reference to the compounds of the invention described herein also includes a reference to a physiologically acceptable salt thereof. Examples of physiologically acceptable salts of the compounds of the invention include salts derived from an appropriate base, such as an alkali metal or an alkaline earth (for example, Na⁺, Li⁺, K⁺, Ca⁺² and Mg⁺²), ammonium and NR₄⁺ (wherein R is defined herein). Physiologically acceptable salts of a nitrogen atom or an amino group include (a) acid addition salts formed with inorganic acids, for example, hydrochloric acid, hydrobromic acid, sulfuric acid, sulfamic acids, phosphoric acid, nitric acid and the like; (b) salts formed with organic acids such as, for example, acetic acid, oxalic acid, tartaric acid, succinic acid, maleic acid, fumaric acid, gluconic acid, citric acid, malic acid, ascorbic acid, benzoic acid, isethionic acid, lactobionic acid, tannic acid, palmitic acid, alginic acid, polyglutamic acid, naphthalenesulfonic acid, methanesulfonic acid, p-toluenesulfonic acid, benzenesulfonic acid, naphthaledisulfonic acid, polygalacturonic acid, malonic acid, sulfosalicylic acid, glycolic acid, 2-hydroxy-3-naphthoate, pamoate, salicylic acid, stearic acid, phthalic acid, mandelic acid, lactic acid, ethanesulfonic acid, lysine, arginine, glutamic acid, glycine, serine, threonine, alanine, isoleucine, leucine and the like; and (c) salts formed from elemental anions for example, chlorine, bromine, and iodine. Physiologically acceptable salts of a compound of a hydroxy group include the anion of said compound in combination with a suitable cation such as Na⁺ and NR₄⁺.

[0167] A compound of Formula I-IV and its pharmaceutically acceptable salts may exist as different polymorphs or pseudopolymorphs. As used herein, crystalline polymorphism means the ability of a crystalline compound to exist in different crystal structures. The crystalline polymorphism may result from differences in crystal packing (packing...
polymorphism) or differences in packing between different conformers of the same molecule (conformational polymorphism). As used herein, crystalline pseudopolymorphism means the ability of a hydrate or solvate of a compound to exist in different crystal structures. The pseudopolymorphs of the instant invention may exist due to differences in crystal packing (packing pseudopolymorphism) or due to differences in packing between different conformers of the same molecule (conformational pseudopolymorphism). The instant invention comprises all polymorphs and pseudopolymorphs of the compounds of Formula I-III and their pharmaceutically acceptable salts.

[0168] A compound of Formula I-IV and its pharmaceutically acceptable salts may also exist as an amorphous solid. As used herein, an amorphous solid is a solid in which there is no long-range order of the positions of the atoms in the solid. This definition applies as well when the crystal size is two nanometers or less. Additives, including solvents, may be used to create the amorphous forms of the instant invention. The instant invention comprises all amorphous forms of the compounds of Formula I-IV and their pharmaceutically acceptable salts.

[0169] For therapeutic use, salts of active ingredients of the compounds of the invention will be physiologically acceptable, i.e. they will be salts derived from a physiologically acceptable acid or base. However, salts of acids or bases which are not physiologically acceptable may also find use, for example, in the preparation or purification of a physiologically acceptable compound. All salts, whether or not derived form a physiologically acceptable acid or base, are within the scope of the present invention.

[0170] Finally, it is to be understood that the compositions herein comprise compounds of the invention in their un-ionized, as well as zwitterionic form, and combinations with stoichiometric amounts of water as in hydrates.

[0171] It is to be noted that all enantiomers, diastereomers, and racemic mixtures, tautomers, polymorphs, pseudopolymorphs of compounds within the scope of Formula I-IV and pharmaceutically acceptable salts thereof are embraced by the present invention. All mixtures of such enantiomers and diastereomers are within the scope of the present invention.

[0172] The compounds of the invention, exemplified by Formula I-IV may have chiral centers, e.g. chiral carbon or phosphorus atoms. The compounds of the invention thus include racemic mixtures of all stereoisomers, including enantiomers, diastereomers, and
atropisomers. In addition, the compounds of the invention include enriched or resolved optical isomers at any or all asymmetric, chiral atoms. In other words, the chiral centers apparent from the depictions are provided as the chiral isomers or racemic mixtures. Both racemic and diastereomeric mixtures, as well as the individual optical isomers isolated or synthesized, substantially free of their enantiomeric or diastereomeric partners, are all within the scope of the invention. The racemic mixtures are separated into their individual, substantially optically pure isomers through well-known techniques such as, for example, the separation of diastereomeric salts formed with optically active adjuncts, e.g., acids or bases followed by conversion back to the optically active substances. In most instances, the desired optical isomer is synthesized by means of stereospecific reactions, beginning with the appropriate stereoisomer of the desired starting material.

[0173] Stereochemical definitions and conventions used herein generally follow S. P. Parker, Ed., McGraw-Hill Dictionary of Chemical Terms (1984) McGraw-Hill Book Company, New York; and Eliel, E. and Wilen, S., Stereochemistry of Organic Compounds (1994) John Wiley & Sons, Inc., New York. Many organic compounds exist in optically active forms, i.e., they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L or R and S are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l, D and L, or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with S, (-), or 1 meaning that the compound is levorotatory while a compound prefixed with R, (+), or d is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture or a racemate, which may occur where there has been no stereoselection or stereospecificity in a chemical reaction or process. The terms "racemic mixture" and "racemate" refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

[0174] The compounds of the invention can also exist as tautomeric isomers in certain cases. Although only one delocalized resonance structure may be depicted, all such forms are contemplated within the scope of the invention. For example, ene-amine tautomers can exist
for purine, pyrimidine, imidazole, guanidine, amidine, and tetrazole systems and all their possible tautomeric forms are within the scope of the invention.

[0175] Any formula or structure given herein, including Formula I compounds, is also intended to represent unlabeled forms as well as isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the disclosure include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, such as, but not limited to $^2$H (deuterium), $^3$H (tritium), $^{11}$C, $^{13}$C, $^{14}$C, $^{15}$N, $^{18}$F, $^{31}$P, $^{32}$P, $^{35}$S, $^{36}$Cl and $^{125}$I. Various isotopically labeled compounds of the present disclosure, for example those into which radioactive isotopes such as $^3$H, $^{13}$C and $^{14}$C are incorporated. Such isotopically labelled compounds may be useful in metabolic studies, reaction kinetic studies, detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays or in radioactive treatment of patients.

[0176] The disclosure also included compounds of Formula I in which from 1 to n hydrogens attached to a carbon atom is/are replaced by deuterium, in which n is the number of hydrogens in the molecule. Such compounds exhibit increased resistance to metabolism and are thus useful for increasing the half-life of any compound of Formula I when administered to a mammal, particularly a human. See, for example, Foster, “Deuterium Isotope Effects in Studies of Drug Metabolism”, Trends Pharmacol. Sci. 5(12):524-527 (1984). Such compounds are synthesized by means well known in the art, for example by employing starting materials in which one or more hydrogens have been replaced by deuterium.

[0177] Deuterium labeled or substituted therapeutic compounds of the disclosure may have improved DMPK (drug metabolism and pharmacokinetics) properties, relating to distribution, metabolism and excretion (ADME). Substitution with heavier isotopes such as deuterium may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life, reduced dosage requirements and/or an improvement in therapeutic index. An $^{18}$F labeled compound may be useful for PET or SPECT studies. Isotopically labeled compounds of this disclosure and prodrugs thereof can generally be prepared by carrying out the procedures disclosed in the schemes or in the examples and
preparations described below by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent. It is understood that deuterium in this context is regarded as a substituent in the compound of Formula I.

[0178] The concentration of such a heavier isotope, specifically deuterium, may be defined by an isotopic enrichment factor. In the compounds of this disclosure any atom not specifically designated as a particular isotope is meant to represent any stable isotope of that atom. Unless otherwise stated, when a position is designated specifically as "H" or "hydrogen", the position is understood to have hydrogen at its natural abundance isotopic composition. Accordingly, in the compounds of this disclosure any atom specifically designated as a deuterium (D) is meant to represent deuterium.

[0179] Whenever a compound described herein is substituted with more than one of the same designated group, e.g., "R" or "R′", then it will be understood that the groups may be the same or different, i.e., each group is independently selected. Wavy lines, ~~~, indicate the site of covalent bond attachments to the adjoining substructures, groups, moieties, or atoms.

[0180] Selected substituents comprising the compounds of Formula I-IV are present to a recursive degree. In this context, "recursive substituent" means that a substituent may recite another instance of itself. Because of the recursive nature of such substituents, theoretically, a large number of compounds may be present in any given embodiment. For example, R³ comprises a R⁰ substituent. R⁰ can be R. R can be Z³. Z³ can be Z⁴ and Z⁴ can be R or comprise substituents comprising R³. Alternatively, Z³ can be Z⁵ which can comprise substituents comprising R³. One of ordinary skill in the art of medicinal chemistry understands that the total number of such substituents is reasonably limited by the desired properties of the compound intended. Such properties include, by way of example and not limitation, physical properties such as molecular weight, solubility or log P, application properties such as activity against the intended target, and practical properties such as ease of synthesis.

[0181] By way of example and not limitation, Z³ and R⁰ are recursive substituents in certain embodiments. Typically, each recursive substituent can independently occur 20, 19, 18, 17, 16, 15, 14, 13, 12, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, or 0, times in a given embodiment. More typically, each recursive substituent can independently occur 12 or fewer times in a
given embodiment. Even more typically, each recursive substituent can independently occur 3 or fewer times in a given embodiment. For example, $Z^3$ will occur 0 to 8 times, $R^7$ will occur 0 to 6 times in a given embodiment. Even more typically, $Z^5$ will occur 0 to 6 times and $R^7$ will occur 0 to 4 times in a given embodiment.

[0182] Recursive substituents are an intended aspect of the invention. One of ordinary skill in the art of medicinal chemistry understands the versatility of such substituents. To the degree that recursive substituents are present in an embodiment of the invention, the total number will be determined as set forth above.

[0183] The compounds of the present invention can be prepared by methods known to one of skill in the art. For example, the compounds of the present invention can be prepared according to the methods described in U.S. Patent No. 8,008,264 and U.S. Application Publication No. US 2012/0027752.

A. Substituted Forms of the Compounds

[0184] The compounds of the Formula I-IV may comprise a phosphate group as $R^7$, $R^7$ is selected from the group of

\[ a) \quad H, \text{-C(=O)}R^{11}, \text{-C(=O)OR}^{11}, \text{-C(=O)NR}^{11}R^{12}, \text{-C(=O)SR}^{11}, \text{-S(O)R}^{11}, \text{-S(O)NR}^{11}R^{12}, \text{-S(O)OR}^{11}, \text{-S(O)R}_2^{11}, \text{-SO}_2NR^{11}R^{12} \]

wherein

each $R^{11}$ or $R^{12}$ is independently $H$, ($C_1$-$C_8$)alkyl, ($C_2$-$C_8$)alkenyl, ($C_2$-$C_8$)alkynyl, ($C_4$-$C_8$)carbocyclalkyl, optionally substituted aryl, optionally substituted heteroaryl, -$C(=O)(C_1$-$C_8$)alkyl, -$S(O)_n(C_1$-$C_8$)alkyl or aryl($C_1$-$C_8$)alkyl; or $R^{11}$ and $R^{12}$ taken together with a nitrogen to which they are both attached form a 3 to 7 membered heterocyclic ring wherein any one carbon atom of said heterocyclic ring can optionally be replaced with -O-, -S- or $-$NR$^n$;-

each $R^a$ is independently $H$, ($C_1$-$C_8$)alkyl, ($C_2$-$C_8$)alkenyl, ($C_2$-$C_8$)alkynyl, aryl($C_1$-$C_8$)alkyl, ($C_4$-$C_8$)carbocyclalkyl, -$C(=O)R$, -$C(=O)OR$, -$C(=O)NR_2$, -$C(=O)SR$, -$S(O)R$, -$S(O)_2R$, -$S(O)OR$, -$S(O)R_2$ OR -$SO_2NR_2$;

wherein each $R$ is independently $H$, ($C_1$-$C_8$) alkyl, ($C_1$-$C_8$) substituted alkyl, ($C_2$-$C_8$)alkenyl, ($C_2$-$C_8$) substituted alkenyl, ($C_2$-$C_8$) alkynyl, ($C_2$-$C_8$)
substituted alkynyl, C₆–C₂₀ aryl, C₆–C₂₀ substituted aryl, C₂–C₂₀ heterocyclyl, 
C₂–C₂₀ substituted heterocyclyl, arylalkyl or substituted arylalkyl; and

wherein each (C₁–C₆)alkyl, (C₂–C₆)alkenyl, (C₂–C₆)alkynyl or aryl(C₁–C₆)alkyl of each 
R¹¹ or R¹² is, independently, optionally substituted with one or more halo, 
hydroxy, CN, N₃, N(R⁶)₂ or OR⁸; and wherein one or more of the non-terminal 
carbon atoms of each said (C₁–C₆)alkyl may be optionally replaced with -O-, - 
S- or -NR⁸₂,

wherein

Q is O, S, NR, N(O)(R), N(OR), N(O)(OR), or N−NR₂;

Z¹ and Z², when taken together, are −Q¹(C(R²)₂)₂Q¹⁻;

wherein

each Q¹ is independently O, S, or NR; and

each R'' is independently H, F, Cl, Br, I, OH, R, -C(=Q³)R, -C(=Q³)OR,
-SC(=Q³)OR, -SC(=Q³)(N(R)₂), -R(N(R)₂), -N(R)C(=Q³)R, -N(R)C(=Q³)OR,
-N(R)C(=Q³)N(R)₂, -SO₂NR₂, -CN, -N₃, -NO₂, -OR, or Z²; or when taken together, two R'' on the same carbon atom form a carbocyclic ring of 3 to 7 carbon atoms;

each Q² is independently, O, S, NR, N(O)(R), N(OR), N(O)(OR), or N−NR₂; or

Z¹ and Z² are each, independently, a group of the Formula Ia:
wherein:

each $Q^3$ is independently a bond, O, CR$_2$, NR, N(O)(R), N(OR), N(O)(OR), N–NR$_2$, S, S–S, S(O), or S(O)$_2$;

M2 is 0, 1 or 2;

each $R^x$ is independently $R^y$ or the formula:

wherein:

each M1a, M1c, and M1d is independently 0 or 1;

M12c is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 or 12;

$Z^3$ is $Z^4$ or $Z^5$;

$Z^4$ is R, -C(Q$_3$)R$^y$, -C(Q$_3$)Z$^5$, -SO$_2$R$^y$, or -SO$_2$Z$^5$; and

$Z^5$ is a carbocycle or a heterocycle wherein $Z^5$ is independently substituted with 0 to 3 $R^y$ groups.

[0185] $Z^5$ carbocycles and $Z^5$ heterocycles may be independently substituted with 0 to 3 $R^y$ groups. $Z^5$ may be a saturated, unsaturated or aromatic ring comprising a mono- or bicyclic carbocycle or heterocycle. $Z^5$ may have 3 to 10 ring atoms, e.g., 3 to 7 ring atoms. The $Z^5$
rings are saturated when containing 3 ring atoms, saturated or mono-unsaturated when containing 4 ring atoms, saturated, or mono- or di-unsaturated when containing 5 ring atoms, and saturated, mono- or di-unsaturated, or aromatic when containing 6 ring atoms.

[0186] A $Z^5$ heterocycle may be a monocycle having 3 to 7 ring members (2 to 6 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S) or a bicycle having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S). $Z^5$ heterocyclic monocycles may have 3 to 6 ring atoms (2 to 5 carbon atoms and 1 to 2 heteroatoms selected from N, O, and S); or 5 or 6 ring atoms (3 to 5 carbon atoms and 1 to 2 heteroatoms selected from N and S). $Z^5$ heterocyclic bicycles have 7 to 10 ring atoms (6 to 9 carbon atoms and 1 to 2 heteroatoms selected from N, O, and S) arranged as a bicyclo [4,5], [5,5], [5,6], or [6,6] system; or 9 to 10 ring atoms (8 to 9 carbon atoms and 1 to 2 heteroatoms selected from N and S) arranged as a bicyclo [5,6] or [6,6] system. The $Z^5$ heterocycle may be bonded to Q through a carbon, nitrogen, sulfur or other atom by a stable covalent bond.

[0187] $Z^5$ heterocycles include for example, pyridyl, dihydropyridyl isomers, piperidine, pyridazinyl, pyrimidinyl, pyrazinyl, s-triazinyl, oxazolyl, imidazolyl, thiazolyl, isoxazolyl, pyrazolyl, isothiazolyl, furanyl, thiofuranyl, thienyl, and pyrrolyl. $Z^5$ also includes, but is not limited to, examples such as:

[0188] $Z^5$ carbocycles and heterocycles may be independently substituted with 0 to 3 R groups, as defined above. For example, substituted $Z^5$ carbocycles include:
Examples of substituted phenyl carbocycles include:

In another embodiment, Z₅ of the compounds of Formula I-IV is a carbocycle or a heterocycle wherein Z₅ is independently substituted with 0 to 3 R₇ groups, wherein each R₇ is independently H, F, Cl, Br, I, OH, R, -C(=Q₅)R, -C(=Q₅)OR, -C(=Q₅)N(R)₂, -N(R)₂, -N(R)₃, -SR, -S(O)R, -S(O)₂R, -S(O)(OR), -S(O)₂(OR), -OC(=Q₅)R, -OC(=Q₅)OR, -OC(=Q₅)(N(R)₂), -SC(=Q₅)R, -SC(=Q₅)OR, -SC(=Q₅)(N(R)₂), -N(R)C(=Q₅)R, -N(R)C(=Q₅)OR, -N(R)C(=Q₅)N(R)₂, -SO₂NR₂, -CN, -N₃, -NO₂, or -OR.
[0191] Embodiments of Formula I-IV compounds include substructures such as:

wherein each $Q^{3b}$ is, independently, O or N(R). In another aspect of this embodiment, each $Q^{3b}$ is O and each $R^x$ is independently:

wherein $M12c$ is 1, 2 or 3 and each $Q^3$ is independently a bond, O, CR$_2$, or S. In another aspect of this embodiment, one $Q^{3b}$-R$^x$ is NH(R) and the other $Q^{3b}$-R$^x$ is O-R$^x$ wherein R$^x$ is:

wherein $M12c$ is 2. In another aspect of this embodiment, each $Q^{3b}$ is O and each $R^x$ is independently:

wherein $M12c$ is 2. In another aspect of this embodiment, each $Q^{3b}$ is O and each $R^x$ is independently:
wherein M12c is 1 and Q³ is a bond, O, or CR₂.

[0192] Other embodiments of Formulas I-IV compounds include substructures such as:

wherein each Q³ is, independently, O or N(R). In another aspect of this embodiment, each Q³ is O. In another aspect of this embodiment, the substructure is:

wherein R³ is Z³ as defined herein.

[0193] Another embodiment of Formulas I-IV includes the substructures:
wherein each $Q^3c$ is, independently, O, N(R$^3$) or S.

[0194] Another embodiment of Formula I-IV compounds includes the substructures wherein one of $Z^1$ or $Z^2$ together with either $R^3$ or $R^4$ is $Q^3$- and the other of $Z^1$ or $Z^2$ is Formula Ia. Such an embodiment is represented by a compound of Formula Ib selected from:

wherein M12c is 1, 2 or 3 and each Q^3 is independently a bond, O, CR₂, or S. In another aspect of the embodiment of Formula Ib, Z^1 or Z^2 is Q^{3b}-R^x; each Q, Q^3 and Q^{3b} is O and R^x is:

wherein M12c is 2. In another aspect of the embodiment of Formula Ib, Z^1 or Z^2 is Q^{3b}-R^x; each Q, Q^3 and Q^{3b} is O and R^x is:

wherein M12c is 1 and Q^3 is a bond, O, or CR₂.

[0196] Another embodiment of Formula I-IV compounds includes a substructure:

wherein Z^3 is a carbocycle such as phenyl or substituted phenyl. In another aspect of this embodiment, the substructure is:
wherein $Q^{3b}$ is O or N(R) and the phenyl carbocycle is substituted with 0 to 3 R groups. In another aspect of this embodiment of the substructure, $R^{3}$ is:

wherein M12c is 1, 2 or 3 and each $Q^{3}$ is independently a bond, O, CR$_2$, or S.

[0197] Another embodiment of of Formula I-IV includes substructures:

and

[0198] The chiral carbon of the amino acid and lactate moieties may be either the R or S configuration or the racemic mixture.

[0199] Another embodiment of of Formula I-IV is substructure
wherein each Q³ is, independently, -O- or -NH-. In another aspect of this embodiment, R² is (C₁-C₆) alkyl, (C₁-C₆) substituted alkyl, (C₂-C₈) alkenyl, (C₂-C₈) substituted alkenyl, (C₂-C₈) alkynyl or (C₂-C₈) substituted alkynyl. In another aspect of this embodiment, R² is (C₁-C₆) alkyl, (C₁-C₆) substituted alkyl, (C₂-C₈) alkenyl, (C₂-C₈) substituted alkenyl, (C₂-C₈) alkynyl or (C₂-C₈) substituted alkynyl; and R is CH₃. In another aspect of this embodiment, R² is (C₁-C₆) alkyl, (C₁-C₆) substituted alkyl, (C₂-C₈) alkenyl, (C₂-C₈) substituted alkenyl, (C₂-C₈) alkynyl or (C₂-C₈) substituted alkynyl; R is CH₃; and each Q³ is -NH-. In another aspect of this embodiment, Z¹ and Z² are, independently, nitrogen-linked, naturally occurring amino acids or naturally occurring amino acid esters. In another aspect of this embodiment, Z¹ and Z² are, independently, naturally-occurring 2-hydroxy carboxylic acids or naturally-occurring 2-hydroxy carboxylic acid esters wherein the acid or ester is linked to P through the 2-hydroxy group.

[0200] Another embodiment of Formula I-IV is substructure:

[0201] In one aspect of this embodiment, each R¹ is, independently, (C₁-C₆) alkyl. In another aspect of this embodiment, each R¹ is, independently, C₆-C₂₀ aryl or C₆-C₂₀ substituted aryl.

B. Metabolites of the Compounds of the Invention

[0204] Also falling within the scope of this invention are the in vivo metabolic products of the compounds described herein, to the extent such products are novel and unobvious over the prior art. Such products may result for example from the oxidation, reduction, hydrolysis, amidation, esterification and the like of the administered compound, primarily due to enzymatic processes. Accordingly, the invention includes novel and unobvious compounds
produced by a process comprising contacting a compound of this invention with a mammal for a period of time sufficient to yield a metabolic product thereof. Such products typically are identified by preparing a radiolabelled (e.g. $^{14}$C or $^3$H) compound of the invention, administering it parenterally in a detectable dose (e.g. greater than about 0.5 mg/kg) to an animal such as rat, mouse, guinea pig, monkey, or to man, allowing sufficient time for metabolism to occur (typically about 30 seconds to 30 hours) and isolating its conversion products from the urine, blood or other biological samples. These products are easily isolated since they are labeled (others are isolated by the use of antibodies capable of binding epitopes surviving in the metabolite). The metabolite structures are determined in conventional fashion, e.g. by MS or NMR analysis. In general, analysis of metabolites is done in the same way as conventional drug metabolism studies well-known to those skilled in the art. The conversion products, so long as they are not otherwise found in vivo, are useful in diagnostic assays for therapeutic dosing of the compounds of the invention even if they possess no anti arenaviridae activity of their own.

[0205] Recipes and methods for determining stability of compounds in surrogate gastrointestinal secretions are known. Compounds are defined herein as stable in the gastrointestinal tract where less than about 50 mole percent of the protected groups are deprotected in surrogate intestinal or gastric juice upon incubation for 1 hour at 37°C. Simply because the compounds are stable to the gastrointestinal tract does not mean that they cannot be hydrolyzed in vivo. The prodrugs of the invention typically will be stable in the digestive system but may be substantially hydrolyzed to the parental drug in the digestive lumen, liver or other metabolic organ, or within cells in general.

III. PHARMACEUTICAL FORMULATIONS

[0206] The compounds of this invention are formulated with conventional carriers and excipients, which will be selected in accord with ordinary practice. Tablets will contain excipients, glidants, fillers, binders and the like. Aqueous formulations are prepared in sterile form, and when intended for delivery by other than oral administration generally will be isotonic. All formulations will optionally contain excipients such as those set forth in the "Handbook of Pharmaceutical Excipients" (1986). Excipients include ascorbic acid and other antioxidants, chelating agents such as EDTA, carbohydrates such as dextran, hydroxyalkylcelullose, hydroxyalkylmethylcellulose, stearic acid and the like. The pH of the
formulations ranges from about 3 to about 11, but is ordinarily about 7 to 10. In some embodiments, the pH of the formulations ranges from about 2 to about 5, but is ordinarily about 3 to 4.

[0207] While it is possible for the active ingredients to be administered alone it may be preferable to present them as pharmaceutical formulations. The formulations, both for veterinary and for human use, of the invention comprise at least one active ingredient, as above defined, together with one or more acceptable carriers therefor and optionally other therapeutic ingredients, particularly those additional therapeutic ingredients as discussed herein. The carrier(s) must be “acceptable” in the sense of being compatible with the other ingredients of the formulation and physiologically innocuous to the recipient thereof.

[0208] The formulations include those suitable for the foregoing administration routes. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. Techniques and formulations generally are found in Remington's Pharmaceutical Sciences (Mack Publishing Co., Easton, PA). Such methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

[0209] Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous or non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be administered as a bolus, electuary or paste.

[0210] A tablet is made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered active ingredient moistened with an inert liquid diluent. The tablets may optionally be coated or
scored and optionally are formulated so as to provide slow or controlled release of the active ingredient therefrom.

[0211] For infections of the eye or other external tissues e.g. mouth and skin, the formulations are preferably applied as a topical ointment or cream containing the active ingredient(s) in an amount of, for example, 0.075 to 20% w/w (including active ingredient(s) in a range between 0.1% and 20% in increments of 0.1% w/w such as 0.6% w/w, 0.7% w/w, etc.), preferably 0.2 to 15% w/w and most preferably 0.5 to 10% w/w. When formulated in an ointment, the active ingredients may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base.

[0212] If desired, the aqueous phase of the cream base may include, for example, at least 30% w/w of a polyhydric alcohol, i.e. an alcohol having two or more hydroxyl groups such as propylene glycol, butane 1,3-diol, mannitol, sorbitol, glycerol and polyethylene glycol (including PEG 400) and mixtures thereof. The topical formulations may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethyl sulfoxide and related analogs.

[0213] The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier (otherwise known as an emulgent), it desirably comprises a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make up the so-called emulsifying wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations.

[0214] Emulgents and emulsion stabilizers suitable for use in the formulation of the invention include Tween® 60, Span® 80, cetostearyl alcohol, benzyl alcohol, myristyl alcohol, glyceryl mono-stearate and sodium lauryl sulfate. Further emulgents and emulsion stabilizers suitable for use in the formulation of the invention include Tween® 80.
[0215] The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties. The cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters known as Crodamol CAP may be used, the last three being preferred esters. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white soft paraffin and/or liquid paraffin or other mineral oils are used.

[0216] Pharmaceutical formulations according to the present invention comprise a combination according to the invention together with one or more pharmaceutically acceptable carriers or excipients and optionally other therapeutic agents. Pharmaceutical formulations containing the active ingredient may be in any form suitable for the intended method of administration. When used for oral use for example, tablets, troches, lozenges, aqueous or oil suspensions, dispersible powders or granules, emulsions, hard or soft capsules, syrups or elixirs may be prepared. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions and such compositions may contain one or more agents including sweetening agents, flavoring agents, coloring agents and preserving agents, in order to provide a palatable preparation. Tablets containing the active ingredient in admixture with non-toxic pharmaceutically acceptable excipient which are suitable for manufacture of tablets are acceptable. These excipients may be, for example, inert diluents, such as calcium or sodium carbonate, lactose, calcium or sodium phosphate; granulating and disintegrating agents, such as maize starch, or alginic acid; binding agents, such as starch, gelatin or acacia; and lubricating agents, such as magnesium stearate, stearic acid or talc. Tablets may be uncoated or may be coated by known techniques including microencapsulation to delay disintegration and adsorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glycercyl monostearate or glycercyl distearate alone or with a wax may be employed.

[0217] Formulations for oral use may be also presented as hard gelatin capsules where the active ingredient is mixed with an inert solid diluent, for example calcium phosphate or
kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, such as peanut oil, liquid paraffin or olive oil.

[0218] Aqueous suspensions of the invention contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients include a suspending agent, such as sodium carboxymethylcellulose, methylcellulose, hydroxypropyl methylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth and gum acacia, and dispersing or wetting agents such as a naturally-occurring phosphatide (e.g., lecithin), a condensation product of an alkylene oxide with a fatty acid (e.g., polyoxyethylene stearate), a condensation product of ethylene oxide with a long chain aliphatic alcohol (e.g., heptadecaethyleneoxycetanol), a condensation product of ethylene oxide with a partial ester derived from a fatty acid and a hexitol anhydride (e.g., polyoxyethylene sorbitan monooleate). The aqueous suspension may also contain one or more preservatives such as ethyl or n-propyl p-hydroxy-benzoate, one or more coloring agents, one or more flavoring agents and one or more sweetening agents, such as sucrose or saccharin. Further non-limiting examples of suspending agents include Cyclodextrin and Captisol (=Sulfobutyl ether beta-cyclodextrin; SEB-beta-CD).

[0219] Oil suspensions may be formulated by suspending the active ingredient in a vegetable oil, such as arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oral suspensions may contain a thickening agent, such as beeswax, hard paraffin or cetyl alcohol. Sweetening agents, such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an antioxidant such as ascorbic acid.

[0220] Dispersible powders and granules of the invention suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, a suspending agent, and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those disclosed above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

[0221] The pharmaceutical compositions of the invention may also be in the form of oil-in-water emulsions. The oily phase may be a vegetable oil, such as olive oil or arachis oil, a mineral oil, such as liquid paraffin, or a mixture of these. Suitable emulsifying agents include
naturally-occurring gums, such as gum acacia and gum tragacanth, naturally-occurring phosphatides, such as soybean lecithin, esters or partial esters derived from fatty acids and hexitol anhydrides, such as sorbitan monooleate, and condensation products of these partial esters with ethylene oxide, such as polyoxyethylene sorbitan monooleate. The emulsion may also contain sweetening and flavoring agents. Syrups and elixirs may be formulated with sweetening agents, such as glycerol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative, a flavoring or a coloring agent.

[0222] The pharmaceutical compositions of the invention may be in the form of a sterile injectable preparation, such as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, such as a solution in 1,3-butane-diol or prepared as a lyophilized powder. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile fixed oils may conventionally be employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid may likewise be used in the preparation of injectables. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution isotonic sodium chloride solution, and hypertonic sodium chloride solution.

[0223] The amount of active ingredient that may be combined with the carrier material to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. For example, a time-release formulation intended for oral administration to humans may contain approximately 1 to 1000 mg of active material compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95% of the total compositions (weight:weight). The pharmaceutical composition can be prepared to provide easily measurable amounts for administration. For example, an aqueous solution intended for intravenous infusion may contain from about 3 to 500 μg of the active ingredient per milliliter of solution in order that infusion of a suitable volume at a rate of about 30 mL/hr can occur.

[0224] Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an
aqueous solvent for the active ingredient. The active ingredient is preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10%, and particularly about 1.5% w/w.

[0225] Formulations suitable for topical administration in the mouth include lozenges comprising the active ingredient in a flavored basis, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

[0226] Formulations for rectal administration may be presented as a suppository with a suitable base comprising for example cocoa butter or a salicylate.

[0227] Formulations suitable for intrapulmonary or nasal administration have a particle size for example in the range of 0.1 to 500 microns, such as 0.5, 1, 30, 35 etc., which is administered by rapid inhalation through the nasal passage or by inhalation through the mouth so as to reach the alveolar sacs. Suitable formulations include aqueous or oily solutions of the active ingredient. Formulations suitable for aerosol or dry powder administration may be prepared according to conventional methods and may be delivered with other therapeutic agents such as compounds heretofore used in the treatment or prophylaxis of Arenaviridae infections as described below.

[0228] Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

[0229] Formulations suitable for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents.

[0230] The formulations are presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injection, immediately prior to use. Extemporaneous injection solutions and suspensions are prepared
from sterile powders, granules and tablets of the kind previously described. Preferred unit dosage formulations are those containing a daily dose or unit daily sub-dose, as herein above recited, or an appropriate fraction thereof, of the active ingredient.

[0231] It should be understood that in addition to the ingredients particularly mentioned above the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavoring agents.

[0232] The invention further provides veterinary compositions comprising at least one active ingredient as above defined together with a veterinary carrier therefor.

[0233] Veterinary carriers are materials useful for the purpose of administering the composition and may be solid, liquid or gaseous materials which are otherwise inert or acceptable in the veterinary art and are compatible with the active ingredient. These veterinary compositions may be administered orally, parenterally or by any other desired route.

[0234] Compounds of the invention are used to provide controlled release pharmaceutical formulations containing as active ingredient one or more compounds of the invention ("controlled release formulations") in which the release of the active ingredient are controlled and regulated to allow less frequency dosing or to improve the pharmacokinetic or toxicity profile of a given active ingredient.

IV. ROUTES OF ADMINISTRATION

[0235] One or more compounds of the invention (herein referred to as the active ingredients) are administered by any route appropriate to the condition to be treated. Suitable routes include oral, rectal, nasal, pulmonary, topical (including buccal and sublingual), vaginal and parenteral (including subcutaneous, intramuscular, intravenous, intradermal, intrathecal and epidural), and the like. It will be appreciated that the preferred route may vary with for example the condition of the recipient. An advantage of the compounds of this invention is that they are orally bioavailable and can be dosed orally.

[0236] In the methods of the present invention for the treatment of Arenaviridae infection, the compounds of the present invention can be administered at any time to a human who may come into contact with humans suffering from Arenaviridae infection or is already suffering
from * Arenaviridae* infection. In some embodiments, the compounds of the present invention can be administered prophylactically to humans coming into contact with humans suffering from * Arenaviridae* infection. In some embodiments, administration of the compounds of the present invention can be to humans testing positive for * Arenaviridae* infection but not yet showing symptoms of * Arenaviridae* infection. In some embodiments, administration of the compounds of the present invention can be to humans upon commencement of symptoms of * Arenaviridae* infection.

[0237] Effective dose of active ingredient depends at least on the nature of the condition being treated, toxicity, whether the compound is being used prophylactically (lower doses) or against an active viral infection, the method of delivery, and the pharmaceutical formulation, and will be determined by the clinician using conventional dose escalation studies. It can be expected to be from about 0.0001 to about 100 mg/kg body weight per day; typically, from about 0.01 to about 10 mg/kg body weight per day; more typically, from about .01 to about 5 mg/kg body weight per day; most typically, from about .05 to about 0.5 mg/kg body weight per day. For example, the daily candidate dose for an adult human of approximately 70 kg body weight will range from 1 mg to 1000 mg, preferably between 5 mg and 500 mg, and may take the form of single or multiple doses.

[0238] The effective dose of a compound of the present invention for treating the * Arenaviridae* infection can depend on whether the dose is to be used prophylactically or to treat a human already suffering from * Arenaviridae* infection. Moreover, the dose can depend on whether the human suffering from * Arenaviridae* infection does not yet show symptoms or is already showing symptoms of * Arenaviridae* infection. Larger doses may be necessary for treating humans testing positive for * Arenaviridae* infection and for humans showing symptoms of * Arenaviridae* infection as compared to humans receiving prophylactic treatment.

[0239] Any suitable period of time for administration of the compounds of the present invention is contemplated. For example, administration can be for from 1 day to 100 days, including 2, 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 40, 50, 60, 70, 80, or 90 days. The administration can also be for from 1 week to 15 weeks, including 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, or 14 weeks. Longer periods of administration are also contemplated. The time for administration can depend on whether the compound is being administered prophylactically or to treat a human suffering from an * Arenaviridae* infection. For example, a prophylactic
administration can be for a period of time while the human is in regular contact with other humans suffering from an *Arenaviridae* infection, and for a suitable period of time following the last contact with a human suffering from an *Arenaviridae* infection. For humans already suffering from an *Arenaviridae* infection, the period of administration can be for any length of time necessary to treat the patient and a suitable period of time following a negative test for *Arenaviridae* infection to ensure the *Arenaviridae* infection does not return.

V. COMBINATION THERAPY

[0240] Compositions of the invention are also used in combination with other active ingredients. For the treatment of *Arenaviridae* virus infections, preferably, the other active therapeutic agent is active against *Arenaviridae* virus infections, particularly Lassa virus and Junin virus infections. Non-limiting examples of these other active therapeutic agents are ribavirin, favipiravir (also known as T-705 or Avigan), T-705 monophosphate, T-705 diphosphate, T-705 triphosphate, ST-193, and mixtures thereof. The compounds and compositions of the present invention are also intended for use with general care provided patients with *Arenaviridae* viral infections, including parenteral fluids (including dextrose saline and Ringer’s lactate) and nutrition, antibiotic (including metronidazole and cephalosporin antibiotics, such as ceftriaxone and cefuroxime) and/or antifungal prophylaxis, fever and pain medication, antiemetic (such as metoclopramide) and/or anti-diarrheal agents, vitamin and mineral supplements (including Vitamin K and zinc sulfate), anti-inflammatory agents (such as ibuprofen), pain medications, and medications for other common diseases in the patient population, such as anti-malarial agents (including artemether and artesunate-lumefantrine combination therapy), typhoid (including quinolone antibiotics, such as ciprofloxacin, macrolide antibiotics, such as azithromycin, cephalosporin antibiotics, such as ceftriaxone, or aminopenicillins, such as ampicillin), or shigellosis.

[0241] It is also possible to combine any compound of the invention with one or more additional active therapeutic agents in a unitary dosage form for simultaneous or sequential administration to a patient. The combination therapy may be administered as a simultaneous or sequential regimen. When administered sequentially, the combination may be administered in two or more administrations.

[0242] Co-administration of a compound of the invention with one or more other active therapeutic agents generally refers to simultaneous or sequential administration of a
compound of the invention and one or more other active therapeutic agents, such that therapeutically effective amounts of the compound of the invention and one or more other active therapeutic agents are both present in the body of the patient.

[0243] Co-administration includes administration of unit dosages of the compounds of the invention before or after administration of unit dosages of one or more other active therapeutic agents, for example, administration of the compounds of the invention within seconds, minutes, or hours of the administration of one or more other active therapeutic agents. For example, a unit dose of a compound of the invention can be administered first, followed within seconds or minutes by administration of a unit dose of one or more other active therapeutic agents. Alternatively, a unit dose of one or more other therapeutic agents can be administered first, followed by administration of a unit dose of a compound of the invention within seconds or minutes. In some cases, it may be desirable to administer a unit dose of a compound of the invention first, followed, after a period of hours (e.g., 1-12 hours), by administration of a unit dose of one or more other active therapeutic agents. In other cases, it may be desirable to administer a unit dose of one or more other active therapeutic agents first, followed, after a period of hours (e.g., 1-12 hours), by administration of a unit dose of a compound of the invention.

[0244] The combination therapy may provide “synergy” and “synergistic”, i.e. the effect achieved when the active ingredients used together is greater than the sum of the effects that results from using the compounds separately. A synergistic effect may be attained when the active ingredients are: (1) co-formulated and administered or delivered simultaneously in a combined formulation; (2) delivered by alternation or in parallel as separate formulations; or (3) by some other regimen. When delivered in alternation therapy, a synergistic effect may be attained when the compounds are administered or delivered sequentially, e.g. in separate tablets, pills or capsules, or by different injections in separate syringes. In general, during alternation therapy, an effective dosage of each active ingredient is administered sequentially, i.e. serially, whereas in combination therapy, effective dosages of two or more active ingredients are administered together. A synergistic anti-viral effect denotes an antiviral effect which is greater than the predicted purely additive effects of the individual compounds of the combination.

[0245] In still yet another embodiment, the present application provides for methods of inhibiting Arenaviridae polymerase in a cell, comprising: contacting a cell infected with an
arenavirus with an effective amount of a compound of Formula I-IV, or a pharmaceutically acceptable salt, solvate, and/or ester thereof, whereby Arenaviridae polymerase is inhibited.

[0246] In still yet another embodiment, the present application provides for methods of inhibiting Arenaviridae polymerase in a cell, comprising: contacting a cell infected with arenavirus with an effective amount of a compound of Formula I-IV, or a pharmaceutically acceptable salt, solvate, and/or ester thereof, and at least one additional active therapeutic agent, whereby Arenaviridae polymerase is inhibited.

[0247] In still yet another embodiment, the present application provides for methods of inhibiting Arenaviridae polymerase in a cell, comprising: contacting a cell infected with Arenaviridae virus with an effective amount of a compound of Formula I-IV, or a pharmaceutically acceptable salt, solvate, and/or ester thereof, and at least one additional active therapeutic agent selected

[0248] In still yet another embodiment, the present application provides for methods of treating Arenaviridae virus infection in a human, comprising: administering to the patient a therapeutically effective amount of a compound of Formula I-IV, or a pharmaceutically acceptable salt, solvate, and/or ester thereof.

[0249] In still yet another embodiment, the present application provides for methods of treating Arenaviridae virus infection in a human, comprising: administering to the patient a therapeutically effective amount of a compound of Formula I-IV, or a pharmaceutically acceptable salt, solvate, and/or ester thereof, and at least one additional active therapeutic agent, whereby Arenaviridae polymerase is inhibited.

[0250] In still yet another embodiment, the present application provides for methods of treating Arenaviridae virus infection in a human, comprising: administering to the patient a therapeutically effective amount of a compound of Formula I-IV, or a pharmaceutically acceptable salt, solvate, and/or ester thereof, and at least one additional active therapeutic agent.

[0251] Also provided is a kit that includes a compound of Formula I, or a pharmaceutically acceptable salt, pharmaceutically acceptable ester, stereoisomer, mixture of stereoisomers or tautomer thereof. In separate embodiments individual kits are provided includes a compound selected from the group of each of the Formulas herein, as well as each subgroup and
embodiment thereof, including Formula II, Formula II, Formula IV, and individual Compounds 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, and 32 (Compounds 1-32), or a pharmaceutically acceptable salt, pharmaceutically acceptable ester, stereoisomer, mixture of stereoisomers or tautomer thereof. In one aspect, the kit comprises a compound of Formula I, or a pharmaceutically acceptable salt thereof. Each of the individual kits described herein may comprise a label and/or instructions for use of the compound in the treatment of a disease or condition in a subject (e.g., human) in need thereof. In some embodiments, the disease or condition is a human Arenaviridae viral infection, including a Lassa viral infection or a Junin viral infection. In other embodiments, each separate kit may also contain instructions for use of additional medical agents in combination with the compound of Formula I in the treatment of a disease or condition in a subject (e.g., human) in need thereof. In certain of these embodiments, the disease or condition is a human Arenaviridae viral infection, including a Lassa viral infection or a Junin viral infection. In each of the kits herein there is a further embodiment in which the kit comprises individual dose units of a compound as described herein, or a pharmaceutically acceptable salt, racemate, enantiomer, diastereomer, tautomer, polymorph, pseudopolymorph, amorphous form, hydrate or solvate thereof. Examples of individual dosage units may include pills, tablets, capsules, prefilled syringes or syringe cartridges, IV bags, etc., each comprising a therapeutically effective amount of the compound in question, or a pharmaceutically acceptable salt, racemate, enantiomer, diastereomer, tautomer, polymorph, pseudopolymorph, amorphous form, hydrate or solvate thereof. In some embodiments, the kit may contain a single dosage unit and in others multiple dosage units are present, such as the number of dosage units required for a specified regimen or period.

[0252] Also provided are articles of manufacture that include a compound of Formula I, or a pharmaceutically acceptable salt, pharmaceutically acceptable ester, stereoisomer, mixture of stereoisomers or tautomer thereof; and a container. In one aspect, the article of manufacture comprises a compound of Formula I, Formula II, Formula II, Formula IV, and individual Compounds 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, and 32 (Compounds 1-32), or a pharmaceutically acceptable salt thereof, and a container. In separate embodiments, the container of the article
of manufacture may be a vial, jar, ampoule, preloaded syringe, blister package, tin, can, bottle, box, or an intravenous bag.

Also provided as separate embodiments are the uses of a compound selected from each of the Formulas herein, as well as each subgroup and embodiment thereof, including a compound selected from the group of Formula (I), Formula (II), Formula (III), Formula (IV), or one of the specific compounds of the examples herein, including Compounds 1-32, or a pharmaceutically acceptable salt, solvate, and/or ester thereof, in the preparation of a medicament for use in treating an Arenaviridae infection in a human.

VI. METHODS OF INHIBITION OF AN ARENAVIRIDAE POLYMERASE

[0253] Another aspect of the invention relates to methods of inhibiting the activity of Arenaviridae polymerase comprising the step of treating a sample suspected of containing Arenaviridae with a compound or composition of the invention.

[0254] Arenaviridae that can be treated using the methods of the present invention are single-stranded negative sense RNA viruses that typically infect primates. Arenaviruses are able to multiply in virtually all cell types.

Based upon studies in nonhuman primates infected with Lassa virus, the first cells infected appear to be dendritic cells in the lymphoid tissues. Infection progresses to infection of Kupffer cells in liver and parenchymal cells in liver and adrenal gland, endothelial cells in a variety of tissues including nervous tissue, and finally to infection of the epithelium. Evidence of liver infection in humans leading to hepatitis has also been documented.) (Hensley, L., 2011, Virology Journal; Yun, N.E., 2012 Viruses).

There are 30 identified genera of Arenaviruses: Allpahuayo virus (ALLV), Amapari virus (AMAV), Bear Canyon virus (BCNV), Catarina virus, Chapare virus, Cupixi virus (CPXV), Dandenong virus, Flexal virus (FLEV), Guanarito virus (GTOV), Ippy virus (IPPYV), Junin virus (JUNV), Kodoko virus, Lassa virus (LASV; six strains - Josiah, NL, z148, Macenta, AV, and CSF), Latino virus (LATV), Lymphocytic choriomeningitis virus (LCMV), Lujo virus, Machupo virus (MACV), Mobala virus (MOBV), Morogoro virus, Mopeia virus (MOPV), Oliveros virus (OLVV), Parana virus (PARV), Pichinde virus (PICV), Pinhal virus, Pirital virus (PIRV), Sabia virus (SABV), Skinner Tank virus, Tacaribe virus (TCRV), Tamiami virus (TAMV), or Whitewater Arroyo virus (WWAV).
The arenavirus virions are heterogeneous in size from 40 to more than 200 nm in diameter that consist of nucleocapsid surrounded by a lipid envelope. Electron micrographs of the interior of virions show a characteristic granular appearance due to incorporation of host cell ribosomes in virus particles during assembly. The genome of arenaviruses consists of two single-stranded RNA segments, small (S) and large (L). Both genomic segments have an ambisense gene organization and encode two genes in opposite orientation. The L RNA (∼7 kb) encodes the viral RNA-dependent RNA polymerase (L) and the small RING finger zinc-binding protein (Z). The S RNA (∼3.4 kb) encodes the glycoprotein precursor protein (GPC) and the nucleoprotein (NP). GPC is posttranslationally cleaved to yield two envelope glycoproteins GP1 and GP2 and the stable signal peptide (SSP) (Yun, N.E., 2012 Viruses).

[0255] Compositions of the invention may act as inhibitors of arenavirus polymerase, as intermediates for such inhibitors or have other utilities as described below. The inhibitors will bind to locations on the surface or in a cavity of Arenaviridae polymerase having a geometry unique to Arenaviridae polymerase. Compositions binding Arenaviridae polymerase may bind with varying degrees of reversibility. Those compounds binding substantially irreversibly are ideal candidates for use in this method of the invention. Once labeled, the substantially irreversibly binding compositions are useful as probes for the detection of Arenaviridae polymerase. Accordingly, the invention relates to methods of detecting Arenaviridae polymerase in a sample suspected of containing Arenaviridae polymerase comprising the steps of: treating a sample suspected of containing Arenaviridae polymerase with a composition comprising a compound of the invention bound to a label; and observing the effect of the sample on the activity of the label. Suitable labels are well known in the diagnostics field and include stable free radicals, fluorophores, radioisotopes, enzymes, chemiluminescent groups and chromogens. The compounds herein are labeled in conventional fashion using functional groups such as hydroxyl, carboxyl, sulfhydryl or amino.

[0256] Within the context of the invention, samples suspected of containing Arenaviridae polymerase include natural or man-made materials such as living organisms; tissue or cell cultures; biological samples such as biological material samples (blood, serum, urine, cerebrospinal fluid, tears, sputum, saliva, tissue samples, and the like); laboratory samples; food, water, or air samples; bioproduct samples such as extracts of cells, particularly recombinant cells synthesizing a desired glycoprotein; and the like. Typically the sample will
be suspected of containing an organism which produces Arenaviridae polymerase, frequently a pathogenic organism such as an Arenaviridae virus. Samples can be contained in any medium including water and organic solvent/water mixtures. Samples include living organisms such as humans, and manmade materials such as cell cultures.

[0257] The treating step of the invention comprises adding the composition of the invention to the sample or it comprises adding a precursor of the composition to the sample. The addition step comprises any method of administration as described above.

[0258] If desired, the activity of Arenaviridae polymerase after application of the composition can be observed by any method including direct and indirect methods of detecting Arenaviridae polymerase activity. Quantitative, qualitative, and semiquantitative methods of determining Arenaviridae polymerase activity are all contemplated. Typically one of the screening methods described above are applied, however, any other method such as observation of the physiological properties of a living organism are also applicable.

[0259] Organisms that contain Arenaviridae polymerase include the Arenaviridae virus. The compounds of this invention are useful in the treatment or prophylaxis of Arenaviridae infections in animals or in man.

[0260] However, in screening compounds capable of inhibiting human Arenaviridae viruses, it should be kept in mind that the results of enzyme assays may not correlate with cell culture assays. Thus, a cell based assay should be the primary screening tool.

[0261] In another embodiment, the present application provides for methods of treating Arenaviridae virus infection in a human, comprising: administering to the patient a therapeutically effective amount of a compound of Formula I-IV, or a pharmaceutically acceptable salt, solvate, and/or ester thereof. In some embodiments, the Arenaviridae infection is caused by an Arenaviridae virus. In some embodiments, the Arenaviridae infection is caused by a Junin virus. In some embodiments, the Arenaviridae infection is caused by Lassa virus strains Josiah, NL, z148, Macenta, AV, or CSF. In some embodiments, an Arenaviridae polymerase is inhibited.

[0262] The compounds of the present invention can be used in the treatment of a human already suffering from an Arenaviridae infection, or can be administered prophylactically to reduce or prevent the chance of an Arenaviridae infection. Physical examination of patients
infected with arenavirus after the onset of fever often reveals purulent pharyngitis, bilateral conjunctival hemorrhages, facial edema, and generalized abdominal tenderness. Macroscopic pathological changes can include pleural effusions, pulmonary edema, ascites, and hemorrhagic manifestations in the gastrointestinal mucosa. Mortality rates for hospitalized patients vary between 5-10%.

VII. SCRENS FOR ARENAVIRIDAE POLYMERASE INHIBITORS.

[0263] Compositions of the invention are screened for inhibitory activity against Arenaviridae polymerase by any of the conventional techniques for evaluating enzyme activity. Within the context of the invention, typically compositions are first screened for inhibition of Arenaviridae polymerase in vitro and compositions showing inhibitory activity are then screened for activity in vivo. Compositions having in vitro Ki (inhibitory constants) of less than about 5 X 10^-6 M and preferably less than about 1 X 10^-7 M are preferred for in vivo use.

[0264] Useful in vitro screens have been described in detail and will not be elaborated here. However, the examples describe suitable in vitro assays.

VIII. PREPARATION OF COMPOUNDS

[0265] The compounds of the present invention can be prepared by a variety of means. For example, protected nucleosides of Formula V can be prepared by reaction of a protected lactone with an iodo-substituted base under suitable coupling conditions. The nucleosides can then be modified with a prodrug moiety by reaction of a partially protected nucleoside with a suitable prodrug moiety, following be removal of the protecting groups, to afford the compounds of the present invention.

A. Preparation of Nucleosides via Iodo-Base

[0266] In some embodiments, the present invention provides a method of preparing a compound of Formula V:
The method of making the compound of Formula V includes forming a reaction mixture having a coupling agent, a halo-silane, a compound of Formula VI:

and a compound of Formula VII:

under conditions suitable to prepare the compound of Formula V, wherein each PG is independently a hydroxy protecting group, alternatively, two PG groups on adjacent carbons can be combined to form a $\sim\text{C}(\text{R}^{10})_2\sim$ group, $\text{R}^{10}$ is H or a silyl group, and $\text{R}^{19}$ is H, C$_1$-C$_8$ alkyl, phenyl or substituted phenyl.

[0267] Any suitable coupling agent can be used in the method of making the compound of Formula V. The coupling agent can be a lithium coupling agent, a sodium coupling agent, a magnesium coupling agent, or others. For example, the coupling agent can be a deprotonating agent such as n-butyl lithium (n-BuLi), sodium hydride (NaH), lithium aluminum hydride (LAH or LiAlH$_4$), and others. The coupling agent can also be a magnesium based coupling agent such as, but not limited to, MgCl$_2$, iPrMgCl, tBuMgCl, PhMgCl, or combinations thereof. In some embodiments, the coupling agent can be a lithium coupling agent or a magnesium coupling agent. In some embodiments, the coupling agent can be n-BuLi, MgCl$_2$, iPrMgCl, tBuMgCl, PhMgCl, or combinations thereof. In some embodiments, the coupling agent can be n-BuLi. In some embodiments, the coupling agent can be PhMgCl and iPrMgCl.

[0268] The coupling agent can be present in any suitable amount. For example, the coupling agent can be present in an amount of at least 1.0 eq. (mol/mol) to the compound of
Formula V, such as about 1.0, 2, 3, 4, 5, 6, 7, 8, 9, or about 10.0 eq. (mol/mol). The coupling agent can also be present in an amount of from about 1.0 to about 10.0 eq. (mol/mol) to the compound of Formula V, such as of from about 1.0 to about 5.0 eq. (mol/mol), or of from about 1.0 to about 2.0 eq. (mol/mol). In some embodiments, the coupling agent can be present in an amount of from about 1.0 to about 5.0 eq. (mol/mol) to the compound of Formula V. In some embodiments, the coupling agent can be present in an amount of from about 1.0 to about 2.0 eq. (mol/mol) to the compound of Formula V.

[0269] Any suitable halo-silane can be used in the method of making the compound of Formula V. For example, the halo-silane can be a fluoro-silane, a chloro-silane, a bromo-silane or an iodo-silane. The silane portion can have any suitable substituents, such as alkyl, alkenyl, alkynyl, cycloalkyl, or phenyl. Exemplary halo-silanes include, but are not limited to, Cl-Si(CH$_3$)$_3$, or Cl-Si(CH$_3$)$_2$CH$_2$CH$_2$Si(CH$_3$)$_2$-Cl. In some embodiments, the halo-silane can be a chloro-silane. In some embodiments, the halo-silane can be Cl-Si(CH$_3$)$_3$, or Cl-Si(CH$_3$)$_2$CH$_2$CH$_2$Si(CH$_3$)$_2$-Cl. In some embodiments, the halo-silane can be TMS-Cl.

[0270] The silyl group of R$^{10}$ can be any suitable group, but can depend on the choice of the halo-silane. For example, when the halo-silane is TMS-Cl, the silyl group can be trimethylsilyl.

[0271] The halo-silane can be present in any suitable amount. For example, the halo-silane can be present in an amount of at least 1.0 eq. (mol/mol) to the compound of Formula V, such as about 1.0, 2, 3, 4, 5, 6, 7, 8, 9, or about 10.0 eq. (mol/mol). The halo-silane can also be present in an amount of from about 1.0 to about 10.0 eq. (mol/mol) to the compound of Formula V, such as of from about 1.0 to about 5.0 eq. (mol/mol), or of from about 1.0 to about 2.0 eq. (mol/mol). In some embodiments, the halo-silane can be present in an amount of from about 1.0 to about 5.0 eq. (mol/mol) to the compound of Formula V. In some embodiments, the halo-silane can be present in an amount of from about 1.0 to about 2.0 eq. (mol/mol) to the compound of Formula V.

[0272] The hydroxy protecting group can be any protecting group suitable for a hydroxy functional group. Representative hydroxy protecting groups include, but are not limited to, silanes such as trimethyl silane (TMS), t-butyl dimethyl silane (TBDMS), or t-butyl diphenyl silane (TBDPS), ethers such as methyl-methoxy (MOM), tetrahydropyran (THP), t-butyl, allyl, or benzyl, and esters such as acetyl, pivaloyl, or benzoyl. In some embodiments, the
hydroxy protecting group can be trimethyl silane (TMS), t-butyl dimethyl silane (TBDMS), t-butyl diphenyl silane (TBDPS), methyl-methoxy (MOM), tetrahydropyran (THP), t-butyl, allyl, benzyl, acetyl, pivaloyl, or benzoyl. In some embodiments, the hydroxy protecting group can be benzyl.

[0273] Hydroxy groups on adjacent carbons, referred to as 1,2-hydroxy groups, can form a cyclic protecting group called an acetonide by reaction with a ketone of di-ether. Exemplary acetonides include, but are not limited to acetonide and benzylidene acetal. In some embodiments, the hydroxy protecting groups of hydroxy groups on adjacent carbons can be combined to form acetonide.

[0274] When the R₁⁹ group is C₃₋C₅ alkyl, R₁⁹ can be methyl, ethyl, propyl, isopropyl, butyl, iso-butyl, sec-butyl, t-butyl, pentyl, iso-pentyl, neo-pentyl, hexyl, isohexyl, neo-hexyl, septyl or octyl. In some embodiments, the R₁⁹ group can be methyl.

[0275] Any suitable solvent can be used in the method of the present invention. Representative solvents include, but are not limited to, pentane, pentanes, hexane, hexanes, heptane, heptanes, petroleum ether, cyclopentanes, cyclohexanes, benzene, toluene, xylene, trifluoromethylbenzene, halobenzenes such as chlorobenzene, fluorobenzene, dichlorobenzene and difluorobenzene, methylene chloride, chloroform, acetone, ethyl acetate, diethyl ether, tetrahydrofuran, or combinations thereof. In some embodiments, the solvent can be tetrahydrofuran. Further representative solvents include, but are not limited to 2-Methyltetrahydrofuran, Dibutyl ether, Methyl terti-butyler ether, Dimethoxyethane, Dioxanes (1,4 dioxane), N-methyl pyrrolidinone (NMP), or combinations thereof.

[0276] The reaction mixture of the method can be at any suitable temperature. For example, the temperature of the reaction mixture can be of from about -78 °C to about 100 °C, or of from about -50 °C to about 100 °C, or of from about -25 °C to about 50 °C, or of from about -10 °C to about 25 °C, or of from about 0 °C to about 20 °C. In some embodiments, the temperature of the reaction mixture can be of from about 0 °C to about 20 °C. In some embodiments, the temperature of the reaction mixture can be of from about -30 °C to about -10 °C.

[0277] The reaction mixture of the method can be at any suitable pressure. For example, the reaction mixture can be at atmospheric pressure. The reaction mixture can be also be
exposed to any suitable environment, such as atmospheric gasses, or inert gasses such as nitrogen or argon.

[0278] The method of the present invention can provide the compound of Formula V in any suitable yield. For example, the compound of Formula V can be prepared in a yield of at least about 50%, 55, 60, 65, 70, 75, 80, 85, 90 or at least about 95%.

[0279] The method of the present invention can provide the compound of Formula V in any suitable purity. For example, the compound of Formula V can be prepared in a purity of at least about 90, 95, 96, 97, 98 or at least about 99%. In some embodiments, the compound of Formula V can be prepared in at least 95% purity. In some embodiments, the compound of Formula V can be prepared in at least 98% purity. In some embodiments, the compound of Formula V can be prepared in at least 99% purity.

[0280] In some embodiments, the method including preparing the compound of Formula V:

\[
\begin{align*}
\text{NH}_2 \\
\text{BnO} \quad \text{O} \quad \text{Bn} \\
\text{BnO} \quad \text{OH} \quad \text{OBn}
\end{align*}
\]

wherein the method includes forming the reaction mixture having TMS-Cl, PhMgCl, iPrMgCl, the compound of Formula VI:

\[
\begin{align*}
\text{BnO} \quad \text{O} \quad \text{Bn} \\
\text{BnO} \quad \text{OBn}
\end{align*}
\]

and the compound of Formula VII:

\[
\begin{align*}
\text{NH}_2 \\
\text{N}
\end{align*}
\]

under conditions suitable to prepare the compound of Formula V.

[0281] In some embodiments, the present invention provides the compound:
B. Addition of Prodrug Moiety

The present invention also provides a method of coupling a prodrug moiety to a nucleoside to provide a compound of the present invention. In some embodiments, the present invention provides a method of preparing a compound of Formula VIII:

![Formula VIII](image)

wherein the method includes forming a reaction mixture including a coupling agent, a non-nucleophilic base, a compound of Formula IX:

![Formula IX](image)

and a compound of Formula X:

![Formula X](image)

under conditions suitable to form the compound of Formula VIII, wherein each \( R^a \) is H or PG, each PG group is a hydroxy protecting group, or both PG groups are combined to form \(-\text{C}(\text{R}^{19})_2\text{-}\), \( R^{e1} \) and \( R^{e2} \) are each independently H, C\(_1\)-C\(_8\) alkyl or benzyl, \( R^f \) is H, C\(_1\)-C\(_8\) alkyl, benzyl, C\(_3\)-C\(_6\) cycloalkyl, or \(-\text{CH}_2\text{-C}_3\text{-C}_6\text{ cycloalkyl}, \text{R}^{19}\) is H, C\(_1\)-C\(_8\) alkyl, phenyl or substituted phenyl, and LG is a leaving group.
[0283] Any suitable coupling agent can be used in the method of making the compound of Formula VIII, as described above for the method of making the compound of Formula V. In some embodiments, the coupling agent can be a magnesium coupling agent. In some embodiments, the coupling agent can be MgCl₂, iPrMgCl, tBuMgCl, PhMgCl, or combinations thereof. In some embodiments, the coupling agent can be MgCl₂.

[0284] Any suitable non-nucleophilic base can be used in the method of making the compound of Formula VIII. Representative non-nucleophilic bases include, but are not limited to, triethylamine, diisopropylethyl amine, N,N-diethylaniline, pyridine, 2,6-lutidine, 2,4,6-collidine, 4-dimethylaminopyridine, and quinuclidine. In some embodiments, the non-nucleophilic base can be di-isopropyl ethyl amine (DIPEA).

[0285] The protecting groups PG can be any suitable hydroxy protecting groups, as described above for the method of making the compound of Formula V. Exemplary protecting groups PG can be benzyl, or the PG groups can be combined to form an acetonide. Exemplary acetonides include, but are not limited to acetonide and benzylidene acetal. In some embodiments, the hydroxy protecting groups of hydroxy groups on adjacent carbons can be combined to form acetonide. In some embodiments, the PG groups are combined to form –C(R¹⁹)₂-. In some embodiments, each R² is the protecting group PG where the PG groups are combined to form –C(Me)₂-.

[0286] When the R⁵ group is C₁-C₅ alkyl, each R⁵ can be methyl, ethyl, propyl, isopropyl, butyl, iso-butyl, sec-butyl, t-butyl, pentyl, iso-pentyl, neo-pentyl, hexyl, isohexyl, neo-hexyl, septyl or octyl. In some embodiments, each R⁵ group can be methyl.

[0287] When the R⁶ group is C₁-C₅ alkyl, R⁶ can be methyl, ethyl, propyl, isopropyl, butyl, iso-butyl, sec-butyl, t-butyl, pentyl, iso-pentyl, neo-pentyl, hexyl, iso-hexyl, neo-hexyl, septyl or octyl. In some embodiments, the R⁶ group can be methyl, ethyl, isopropyl, t-butyl, or iso-hexyl. When the R⁶ group is C₃-C₅ cycloalkyl, R⁶ can be cyclopropyl, cyclobutyl, cyclopentyl or cyclohexyl. In some embodiments, R⁶ can be cyclobutyl, cyclopentyl or cyclohexyl.

[0288] When the R¹⁹ group is C₁-C₅ alkyl, R¹⁹ can be methyl, ethyl, propyl, isopropyl, butyl, iso-butyl, sec-butyl, t-butyl, pentyl, iso-pentyl, neo-pentyl, hexyl, iso-hexyl, neo-hexyl, septyl or octyl. In some embodiments, the R¹⁹ group can be methyl.
[0289] The leaving group can be any suitable leaving group. Suitable leaving groups LG include, but are not limited to, chloride, bromide, mesylate, tosylate, triflate, 4-nitrobenzenesulfonate, 4-chlorobenzenesulfonate, 4-nitrophenoxy, pentafluorophenoxy, etc. In some embodiments, the leaving group LG can be 4-nitrophenoxy or pentafluorophenoxy. In some embodiments, the leaving group LG can be 4-nitrophenoxy.

[0290] In some embodiments, each R⁸ is PG where the PG groups are combined to form -C(R¹⁹)₂-, R² is C₁⁻C₈ alkyl, R¹⁹ is C₁⁻C₈ alkyl, and the leaving group LG is 4-nitrophenoxy or pentafluorophenoxy.

[0291] In some embodiments, the coupling agent is MgCl₂, and the non-nucleophilic base is di-isopropyl ethyl amine.

[0292] In some embodiments, the compound of Formula VIII can be

When the R² groups of the compound of Formula VIII are the hydroxy protecting groups PG, the method can include the additional step of removing the protecting groups to form the compound of Formula VIII where each R² is H. In some embodiments, the method of preparing the compound of Formula VIII includes forming a second reaction mixture including a deprotection agent and the compound Formula VIII wherein each R³ group is the protecting group PG, under suitable conditions to form the compound of Formula VIII where each R³ is H. The deprotection agent can be any suitable agent to remove the protecting groups PG such as hydrogen and a hydrogenation catalyst, or acid. For example, if the protecting group PG is benzyl, the deprotection agent can be hydrogen and platinum on carbon. Alternatively, when the protecting group PG is an acetonide, the deprotection agent can be an acid. Representative acids include, but are not limited to, acetic acid, glacial acetic acid, trifluoroacetic acid (TFA), hydrochloric acid, concentrated hydrochloric acid, and others. In some embodiments, the method of preparing the compound of Formula VIII includes forming a second reaction mixture including an acid and the compound Formula
VIII wherein the R³ groups are combined to form -C(R¹⁹)₂-, under suitable conditions to form the compound of Formula VIII where each R³ is H. In some embodiments, the acid can be hydrochloric acid.

[0295] Any suitable solvent can be used in the method of the present invention. Representative solvents include, but are not limited to, pentane, pentanes, hexane, hexanes, heptane, heptanes, petroleum ether, cyclopentanes, cyclohexanes, benzene, toluene, xylene, trifluoromethylbenzene, halobenzenes such as chlorobenzene, fluorobenzene, dichlorobenzene and difluorobenzene, methylene chloride, chloroform, acetone, ethyl acetate, diethyl ether, tetrahydrofuran, acetonitrile, or combinations thereof. In some embodiments, the solvent can be acetonitrile.

[0296] The reaction mixture of the method can be at any suitable temperature. For example, the temperature of the reaction mixture can be of from about -78 °C to about 100 °C, or of from about -50 °C to about 100 °C, or of from about -25 °C to about 50 °C, or of from about -10 °C to about 25 °C, or of from about 0 °C to about 20 °C. In some embodiments, the temperature of the reaction mixture can be of from about 0 °C to about 20 °C.

[0297] The reaction mixture of the method can be at any suitable pressure. For example, the reaction mixture can be at atmospheric pressure. The reaction mixture can be also be exposed to any suitable environment, such as atmospheric gasses, or inert gasses such as nitrogen or argon.

[0298] The method of the present invention can provide the compound of Formula VIII in any suitable yield. For example, the compound of Formula VIII can be prepared in a yield of at least about 50%, 55, 60, 65, 70, 75, 80, 85, 90 or at least about 95%.

[0299] The method of the present invention can provide the compound of Formula VIII in any suitable purity. For example, the compound of Formula VIII can be prepared in a purity of at least about 90, 95, 96, 97, 98 or at least about 99%. In some embodiments, the compound of Formula VIII can be prepared in at least 95% purity. In some embodiments, the compound of Formula VIII can be prepared in at least 98% purity. In some embodiments, the compound of Formula VIII can be prepared in at least 99% purity.

[0300] In some embodiments, the present invention provides the compound

A. Preparation of Compounds

Example 1. (2S)-ethyl 2-(chloro(phenoxyporphylamino)propanoate (Chloridate A)

[0302] Ethyl alanine ester hydrochloride salt (1.69 g, 11 mmol) was dissolved in anhydrous CH₂Cl₂ (10 mL) and the mixture stirred with cooling to 0 °C under N₂(g). Phenyl dichlorophosphate (1.49 mL, 10 mmol) was added followed by dropwise addition of Et₃N over 10 min. The reaction mixture was then slowly warmed to RT and stirred for 12 h. Anhydrous Et₂O (50 mL) was added and the mixture stirred for 30 min. The solid that formed was removed by filtration, and the filtrate concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-50% EtOAc in hexanes to provide intermediate A (1.13 g, 39%). ¹H NMR (300 MHz, CDCl₃) δ 7.39-7.27 (m, 5H), 4.27 (m, 3H), 1.52 (m, 3H), 1.32 (m, 3H). ³¹P NMR (121.4 MHz, CDCl₃) δ 8.2, 7.8.

Example 2. (2S)-2-ethylbutyl 2-(chloro(phenoxyporphylamino)propanoate (Chloridate B)

[0303] The 2-ethylbutyl alanine chlorophosphoramidate ester B was prepared using the same procedure as chloridate A except substituting 2-ethylbutyl alanine ester for ethyl alanine ester. The material is used crude in the next reaction. Treatment with methanol or ethanol forms the displaced product with the requisite LCMS signal.

Example 3. (2S)-isopropyl 2-(chloro(phenoxyporphylamino)propanoate (Chloridate C)
The isopropyl alanine chlorophosphoramidate ester C was prepared using the same procedure as chloridate A except substituting isopropyl alanine ester for the ethyl alanine ester. The material is used crude in the next reaction. Treatment with methanol or ethanol forms the displaced product with the requisite LCMS signal.

Example 4. (2R, 3R, 4S, 5R)-2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-3,4-dihydroxy-5-(hydroxymethyl)tetrahydrofuran-2-carbonitrile (Compound 1)

The preparation of (2R, 3R, 4S, 5R)-2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-3,4-dihydroxy-5-(hydroxymethyl)tetrahydrofuran-2-carbonitrile is described below.

The commercially available lactol (10 g, 23.8 mmol) was dissolved in anhydrous DMSO (30 mL) under N\textsubscript{2}(g). Ac\textsubscript{2}O (20 mL) was added and the resultant reaction mixture stirred at RT for 48 h. The reaction mixture was poured onto ice H\textsubscript{2}O (500 mL) and the mixture stirred for 20 min. The mixture was extracted with EtOAc (3 x 200 mL) and the combined organic extracts were then washed with H\textsubscript{2}O (3 x 200 mL). The organic extract was dried over anhydrous MgSO\textsubscript{4}, filtered and concentrated under reduced pressure. The residue was dissolved in CH\textsubscript{2}Cl\textsubscript{2} and subjected to silica gel chromatography eluting with 25% EtOAc in hexanes to provide the lactone (9.55 g, 96%). \textsuperscript{1}H NMR (400 MHz, DMSO) \( \delta \) 7.30-7.34 (m, 13H), 7.19-7.21 (m, 2H), 4.55-4.72 (m, 6H), 4.47 (s, 2H), 4.28 (d, \( J = 3.9 \) Hz, 1H), 3.66 (m, 2H). The bromopyrazole (prepared according to WO2009/132135) (0.5 g, 2.4 mmol) was suspended in anhydrous THF (10 mL) under N₂(g). The suspension was stirred and TMSCl (0.67 mL, 5.28 mmol) was added. The mixture was stirred for 20 min. at RT and then cooled to -78 °C after which time a solution of n-BuLi (6 mL, 1.6 N in hexanes, 9.6 mmol) was added slowly. The reaction mixture was stirred for 10 min. at -78 °C and then the lactone (1 g, 2.4 mmol) was added via syringe. When the reaction was complete as measured by LCMS, AcOH was added to quench the reaction. The mixture was concentrated under reduced pressure and the residue dissolved in a mixture of CH₂Cl₂ and H₂O (100 mL, 1:1). The organic layer was separated and washed with H₂O (50 mL). The organic layer was then dried over anhydrous MgSO₄, filtered and concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-50% EtOAc in hexanes to provide the product as a 1:1 mixture of anomers (345 mg, 26% yield). LCMS m/z 553 [M+H].

The hydroxy nucleoside (1.1 g, 2.0 mmol) was dissolved in anhydrous CH₂Cl₂ (40 mL) and the solution cooled with stirring to 0 °C under N₂(g). TMSCN (0.931 mL, 7 mmol) was added and the mixture stirred for a further 10 min. TMSOTf (1.63 mL, 9.0 mmol) was slowly added to the reaction and the mixture stirred for 1 h. The reaction mixture was then diluted with CH₂Cl₂ (120 mL) and aqueous NaHCO₃ (120 mL) was added to quench the reaction. The reaction mixture was stirred for a further 10 min and the organic layer separated. The aqueous layer was extracted with CH₂Cl₂ (150 mL) and the combined organic extracts dried over anhydrous MgSO₄, filtered and concentrated under reduced pressure. The residue was dissolved in a minimal amount of CH₂Cl₂ and subjected to silica gel chromatography eluting with a gradient of 0-75% EtOAc and hexanes to provide the tribenzyl cyano nucleoside as a mixture of anomers (0.9 g, 80%). ¹H NMR (300 MHz,

The preparation of (2R,3R,5S)-2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-3-hydroxy-5-(hydroxymethyl)-tetrahydrofuran-2-carbonitrile is described below.

The acetate material (1.2 g, 5.5 mmol) (J. Org. Chem. 1985, 50, 3547, De Bernardo et al) was dissolved in a 1:1 mixture MeOH and THF (10 mL). A 1N solution of NaOH(aq) (10mL) was added until the pH was 13. The reaction mixture was stirred for 2h and then neutralized to pH 8-9 by the addition of AcOH. The mixture was extracted with EtOAc (10 x 30mL) and the combined organic extracts dried over anhydrous Na$_2$SO$_4$, filtered and concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-70% EtOAc in hexanes to give the desired product (866 mg, 90%). $^1$H NMR (300 MHz, CDCl$_3$) δ 5.84 (d, $J$ = 3.6 Hz, 1H), 4.78 (t, $J$ = 4.5 Hz, 1H), 4.38 (m, 1H), 3.93-3.54 (m, 2H), 2.04-1.84 (m, 2H), 1.52 (s, 3H), 1.33 (s, 3H).

Sodium hydride (188 mg, 7.46 mmol) was dissolved in anhydrous THF (5 mL) and stirred under N$_2$(g) at RT. The alcohol (866 mg, 4.97 mmol) was dissolved in anhydrous THF (3 mL) and then added in portions over 5 min. to the sodium hydride mixture. The resultant mixture was stirred for 20 min. and then benzyl bromide (892 µL, 7.46 mmol) was added. The reaction was stirred for 2 h and then poured onto a mixture of ice cold aqueous NaHCO$_3$ and EtOAc (30mL). The organic layer was separated and then the aqueous layer re-extracted with EtOAc (30 mL). The combined organic extracts were dried over anhydrous Na$_2$SO$_4$, filtered and concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-40% EtOAc in hexanes to give the benzyl ether product (912 mg, 69%). $^1$H NMR (300 MHz, CDCl$_3$) δ 7.35-7.27 (m, 5H), 5.86 (d, $J$ = 3.6 Hz, 1H), 4.74 (t, $J$ = 4.2 Hz, 1H), 4.60 (s, 2H), 4.42 (m, 1H), 3.69-3.53 (m, 2H), 2.10-2.04 (m, 1H), 1.83-1.77 (m, 1H), 1.52 (s, 3H), 1.33 (s, 3H).
[0326] (3R,5S)-5-(benzylxomethyl)-tetrahydrofuran-2,3-diol. The benzyl ether (910 mg, 3.44 mmol) was dissolved in a 1:1 AcOH and H₂O (20 mL) mixture and stirred at 60°C for 7h. The mixture was concentrated under reduced pressure and the residue subjected to silica gel chromatography eluting with 0-70% EtOAc in hexanes to give the diol product (705 mg, 91%). ¹H NMR (300 MHz, CDCl₃) δ 7.36-7.27 (m, 5H), 5.40 (d, J = 3.9 Hz, 0.5H), 5.17 (s, 0.5H), 4.67-4.56 (m, 3H), 4.33 (m, 0.5H), 4.24 (d, J = 4.8 Hz, 0.5H), 3.71-3.67 (m, 1H), 3.56-3.42 (m, 2H), 2.31-2.22 (m, 1H), 2.08-1.89 (m, 2H).

[0327] (3R,5S)-5-(benzylxomethyl)-3-hydroxy-dihydrofuran-2(3H)-one. The diol (705 mg, 3.14 mmol) was dissolved in benzene (30 mL) and treated with a silver carbonate celite mixture (3.46 g, 6.28 mmol). The resultant mixture was stirred at 80°C under N₂(g) for 2h. The mixture was then cooled to RT, filtered and concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-70% EtOAc in hexanes to give the lactone product (600 mg, 86%). ¹H NMR (300 MHz, CDCl₃) δ 7.39-7.27 (m, 5H), 4.75-4.68 (m, 1H), 4.60-4.49 (m, 2H), 3.74-3.54 (m, 2H), 2.61-2.35 (m, 2H), 2.38-2.28 (m, 1H).

[0328] (3R,5S)-3-(benzylxoxy)-5-(benzylxomethyl)-dihydrofuran-2(3H)-one. The lactone (600 mg, 2.7 mmol) was dissolved in EtOAc (30mL) and treated with silver oxide (626 mg, 2.7 mmol) followed by benzyl bromide (387 µL, 3.24 mmol). The reaction mixture was then stirred at 50°C under N₂(g) for 8h. Additional silver oxide (300 mg) was then added and the resultant mixture stirred at 50°C for 16h. Additional benzyl bromide (50 uL) and silver oxide (150 mg) were added and the mixture stirred for an additional 8h. The reaction mixture was allowed to cool, filtered and then concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-20% EtOAc in hexanes to give the title product (742 mg, 88%). ¹H NMR (300 MHz, CDCl₃) δ 7.39-7.27 (m, 10H),
4.99 (d, J = 11.4 Hz, 1H), 4.72 (m, 2H), 4.56 (m, 2H), 4.39 (t, J = 8.1 Hz, 1H), 3.72-3.51 (m, 2H), 2.42-2.25 (m, 2H).

[0329] (3R,5S)-2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-3-(benzyloxy)-5-(benzyloxymethyl)-tetrahydrofuran-2-ol. The 7-bromopyrrolo[1,2-f][1,2,4]triazin-4-amine (607 mg, 2.85 mmol) was dissolved in anhydrous THF (10 mL) and stirred under Ar(g) at RT. TMSCl (1.1 mL, 8.55 mmol) was added dropwise and the mixture stirred for 2h. The reaction was concentrated under reduced pressure and then dried under high vacuum. The residue was suspended in THF (20 mL) and stirred under Ar(g) at -78°C. A 2.5M n-BuLi solution in hexane (2.28 mL, 5.7 mmol) was added dropwise over 10 min. and the resultant mixture stirred for 60 min. The lactone (742 mg, 2.37 mmol) dissolved in anhydrous THF (7 mL) was added to the above mixture over 20 min. The reaction mixture was stirred for 2 h. and then quenched with AcOH until pH was 5-6. The mixture was allowed to warm to RT and then diluted with EtOAc. The solution was washed with saturated NaHCO₃ solution, saturated NaCl, dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-80% EtOAc in hexanes to give the title product (250 mg, 24%). LCMS m/z 447.2 [M+H], 445.1 [M−H].

[0330] (3R,5S)-2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-3-(benzyloxy)-5-(benzyloxymethyl)-tetrahydrofuran-2-carbonitrile. The alcohol (250 mg, 0.56 mmol) was dissolved in anhydrous CH₂Cl₂ (10 mL) and stirred under Ar(g) at -15°C. TMSCN (448 µL, 3.36 mmol) was added dropwise and the mixture stirred for 10 min. TMSOTf (466 µL, 2.58 mmol) was added dropwise over 10 min and the resultant mixture stirred for 90 min. at -15°C. Additional TMSCN (224 µL, 3 eq.) and TMSOTf (202 µL, 2 eq.) was added and stirring continued for 5 h. Saturated aqueous NaHCO₃ solution was added to quench the reaction and the mixture stirred for 10 min. The organic layer was separated and washed with
saturated aqueous NaHCO₃ solution, saturated NaCl solution, dried over anhydrous Na₂SO₄, filtered and concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0-70% EtOAc in hexanes to give the title product (150 mg, 59%). LCMS m/z 456.3 [M+H], 454.1 [M−H].

[0331] (2R,3R,5S)2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-3-hydroxy-5-(hydroxymethyl)-tetrahydrofuran-2-carbonitrile (7). The benzyl ether (150 mg, 0.329 mmol) was dissolved in anhydrous CH₂Cl₂ (2 mL) and the mixture stirred under Ar(g) at -20°C. A 1M BCl₃ solution in CH₂Cl₂ (724 µL, 0.724 mmol) was added dropwise and the resultant mixture stirred for 2h. Additional 1M BCl₃ in CH₂Cl₂ (724 µL, 0.724 mmol) was added and stirring continued for 2h. The mixture was then cooled to -78°C and slowly treated with a 2:1 mixture of Et₃N and MeOH (3 mL). The mixture was stirred for 10 min and then treated with MeOH (10 mL). The reaction was allowed to warm to RT and then concentrated under reduced pressure. The residue was dissolved in MeOH and concentrated under reduced pressure. The residue was dissolved in MeOH again and treated with solid NaHCO₃. The mixture was stirred for 5 min and then the solid removed by filtration. The solution was concentrated under reduced pressure and subjected to preparative HPLC to provide the desired product 7 (10 mg, 11%). ¹H NMR (300 MHz, D₂O) δ 7.71 (s, 1H), 6.75 (d, J = 4.5 Hz, 1H), 6.65 (d, J = 4.8 Hz, 1H), 4.91 (t, J = 6.3 Hz, 1H), 4.57 (m, 1H), 3.67-3.47 (m, 2H), 2.18 (m, 2H). Example 12. (2S)-2-ethylbutyl 2-(((2R,3S,4R,5R)-5-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxytetrahydrofuran-2-yl)methoxy)(phenoxy)phosphorylamino)propanoate (Compound 9)

[0333] Compound 9 can be prepared by several methods described below.

Procedure 1

[0334] Prepared from Compound 1 and chloridate B according to the same method as for the preparation of compound 8. ¹H NMR (300 MHz, CD₃OD) δ 7.87 (m, 1H), 7.31-7.16 (m, 5H), 6.92-6.89 (m, 2H), 4.78 (m, 1H), 4.50-3.80 (m, 7H), 1.45-1.24 (m, 8H), 0.95-0.84 (m, 6H). ³¹P NMR (121.4 MHz, CD₃OD) δ 3.7. LCMS m/z 603.1 [M+H], 601.0 [M-H].
Procedure 2

[0335] (2S)-2-ethylbutyl 2-(((2R,3S,4R,5R)-5-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxytetrahydrofuran-2-yl)methoxy)(phenoxy)phosphoryl)amino)propanoate. (2S)-2-ethylbutyl 2-(((4-nitrophenoxy)(phenoxy)phosphoryl)amino)propanoate (1.08 g, 2.4 mmol) was dissolved in anhydrous DMF (9 mL) and stirred under a nitrogen atmosphere at RT. (2R,3R,4S,5R)-2-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-3,4-dihydroxy-5-(hydroxymethyl)tetrahydrofuran-2-carbonitrile (350 mg, 1.2 mmol) was added to the reaction mixture in one portion. A solution of t-butylmagnesium chloride in THF (1M, 1.8 mL, 1.8 mmol) was then added to the reaction dropwise over 10 minutes. The reaction was stirred for 2 h, at which point the reaction mixture was diluted with ethyl acetate (50 mL) and washed with saturated aqueous sodium bicarbonate solution (3 x 15 mL) followed by saturated aqueous sodium chloride solution (15 mL). The organic layer was dried over anhydrous sodium sulfate and concentrated under reduced pressure. The resulting oil was purified with silica gel column chromatography (0-10% MeOH in DCM) to afford (2S)-2-ethylbutyl 2-(((2R,3S,4R,5R)-5-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxytetrahydrofuran-2-yl)methoxy)(phenoxy)phosphoryl)amino)propanoate (311 mg, 43%, 1:0.4 diastereomeric mixture at phosphorus) as a white solid. $^1$H NMR (400 MHz, CD$_3$OD) $\delta$ 7.85 (m, 1H), 7.34 – 7.23 (m, 2H), 7.21 – 7.09 (m, 3H), 6.94 – 6.84 (m, 2H), 4.78 (d, $J$ = 5.4 Hz, 1H), 4.46 – 4.33 (m, 2H), 4.33 – 4.24 (m, 1H), 4.18 (m, 1H), 4.05 – 3.80 (m, 3H), 1.52 – 1.39 (m, 1H), 1.38 – 1.20 (m, 7H), 0.85 (m, 6H). $^{31}$P NMR (162 MHz, CD$_3$OD) $\delta$ 3.71, 3.65. LCMS m/z 603.1 [M+H], 600.9 [M-H]. HPLC (2–98% MeCN–H$_2$O gradient with 0.1% TFA modifier over 8.5 min, 1.5mL/min, Column: Phenomenex Kinetex C18, 2.6 um 100 Å, 4.6 x 100 mm) $\tau_R = 5.544$ min, 5.601 min

Separation of the (S) and (R) Diastereomers

[0336] (2S)-2-ethylbutyl 2-(((2R,3S,4R,5R)-5-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxytetrahydrofuran-2-yl)methoxy)(phenoxy)phosphoryl)amino)propanoate was dissolved in acetonitrile. The resulting solution was loaded onto Lux
Cellulose-2 chiral column, equilibrated in acetonitrile, and eluted with isocratic acetonitrile/methanol (95:5 vol/vol). The first eluting diastereomer had a retention time of 17.4 min, and the second eluting diastereomer had a retention time of 25.0 min.

[0339] The preparation of (2S)-ethyl 2-(((2R,3S,4R,5R)-5-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxycyclohexa-3,4-dihydrofurane-2-yl)methoxy)(phenoxy)phosphorylamino)propanoate is described below.

**Procedure 1. Preparation via Chloridate A**

![Chemical Structure](image)

[0340] Prepared from Compound I and chloridate A using same method as for the preparation of compound 8. ^1^H NMR (300 MHz, CD₃OD) δ 7.95 (m, 1H), 7.32-6.97 (m, 7H), 4.78 (m, 1H), 4.43-4.08 (m, 6H), 3.83 (m, 1H), 1.31-1.18 (m, 6H). ^3^P NMR (121.4 MHz, CD₃OD) δ 3.7. LCMS m/z 547.0 [M+H], 545.0 [M-H].

**Procedure 2. Preparation via Nitro-Benzene Compound L**

![Chemical Structure](image)
[0341] Compound 1 (50 mg, 0.17 mmol) was dissolved in NMP-THF (1:1 mL)) and cooled with ice bath. tBuMgCl (0.257 mL, 0.257 mmol) was then added over 5 min. The resulting mixture was allowed to warm to RT and was stirred for 30 min. Then a solution of compound L (Prepared according to US20120009147, 74.6 mg, 0.189 mmol) in THF (2 mL) was added. After 30 min, the reaction mixture was purified by HPLC (acetonitrile to 80% in water) to give compound 29 as a yellow solid. The solid was further purified with silica gel chromatography (MeOH 0 to 20% DCM) to afford compound 29 (23 mg, 24% as a 2.5:1 mixture of diastereomers). $^1$H NMR (400 MHz, CD$_3$OD) $\delta$ 7.76 (d, $J = 6.0$ Hz, 1H), 7.25–7.14 (m, 2H), 7.11–6.99 (m, 3H), 6.87–6.72 (m, 2H), 4.70 (d, $J = 5.4$ Hz, 1H), 4.39–4.24 (m, 2H), 4.20 (dddd, $J = 9.7, 7.9, 5.1, 2.8$ Hz, 1H), 4.10 (dt, $J = 12.8, 5.5$ Hz, 1H), 4.06–3.91 (m, 2H), 3.72 (ddq, $J = 14.3, 9.3, 7.1$ Hz, 1H), 1.17 (dd, $J = 7.1, 1.0$ Hz, 1H), 1.14–1.06 (m, 5H). $^{31}$P NMR (162 MHz, CD$_3$OD) $\delta$ 3.73 , 3.68. MS m/z = 547 (M+I)$^+$.

[0343] The nucleoside 1 (14.6 mg, 0.05 mmol) was dissolved in anhydrous trimethyl phosphate (0.5 mL) and stirred under N₂(g) at RT. POCl₃ (9.2 µL, 0.1 mmol) was added and the mixture stirred for 60 min. Alanine ethyl ester hydrochloride (61 mg, 0.4 mmol) and then Et₃N (70 µL, 0.5 mmol) was added. The resultant mixture was stirred for 15 min. and then additional Et₃N (70 µL, 0.5 mmol) was added to give a solution pH of 9-10. The mixture was stirred for 2 h. and then diluted with EtOAc, washed with saturated aqueous NaHCO₃ solution followed by saturated aqueous NaCl solution. The organic layer was dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. The residue was subjected to preparative HPLC (C₁₈ column) to yield the product 12 (5.5 mg, 16%). ¹H NMR (400 MHz, CD₃OD) δ 8.13 (s, 1H), 7.41 (d, J = 4.8 Hz, 1H), 7.18 (d, J = 4.8 Hz, 1H), 4.78 (d, J = 5.6 Hz, 1H), 4.36 (m, 1H), 4.25-4.08 (m, 7H), 3.83 (m, 2H), 1.33-1.23 (m, 12H). ³¹P NMR (121.4 MHz, CD₃OD) δ 13.8. Example 16. (2S,3R,4S,5R)-2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-2-ethynyl-5-(hydroxymethyl)tetrahydrofuran-3,4-diol (Compound 13)

[0344] The preparation of (2S,3R,4S,5R)-2-(4-aminopyrrolo[1,2-f][1,2,4]triazin-7-yl)-2-ethynyl-5-(hydroxymethyl)tetrahydrofuran-3,4-diol is described below.
The nucleoside alcohol (0.6 g, 1.08 mmol) (prepared as described in Compound 1 synthesis) was dissolved in anhydrous THF (8 mL) and placed under N₂(g). The reaction mixture was stirred and cooled to 0°C and then treated with a 0.5N solution of ethynyl magnesium bromide in THF (17.2 mL, 17.2 mmol). The reaction mixture was stirred overnight at RT. AcOH (1.5 mL) was added to quench the reaction. The mixture was concentrated under reduced pressure and the residue redissolved in CH₂Cl₂. The solution was subjected to a plug of silica gel eluting with 0 to 80% EtOAc in Hexanes to provide the title product as a crude mixture. LCMS m/z 579 [M+H].

The crude ethynyl alcohol (0.624 g, 1.08 mmol) was dissolved in anhydrous CH₂Cl₂ (10 mL) and placed under N₂(g). The mixture was stirred and sulfonylic acid (0.2 mL, 2.74 mmol) was added. The reaction mixture was stirred for 12 h. at RT. When complete by LCMS, Et₃N (0.56 mL) was added to quench the reaction. The reaction was concentrated under reduced pressure and the residue subjected to silica gel chromatography eluting with 0 to 75% EtOAc in Hexanes to yield the ethynyl nucleoside as a mixture of anomers (0.200 g, 33% over 2 steps). LCMS m/z 561 [M+H].

The tribenzylnucleoside (0.650 g, 1.16 mmol) was dissolved in anhydrous CH₂Cl₂ (30 mL) and cooled to -78°C under N₂(g). A solution of boron tribromide (1 N in CH₂Cl₂, 5.5 mL) was added and the reaction mixture stirred for 1 h. at -78°C. A solution of MeOH (10 mL) and pyridine (2 mL) was added to quench the reaction and the mixture was allowed to rise to RT. The mixture was concentrated under reduced pressure and subjected to preparative HPLC to provide the α-anomer (20 mg) and β-anomer 13 (110 mg). (β-anomer)

**[0349]** The tribenzyl alcohol from Compound 1 synthesis (0.250 g, 0.453 mmol) was dissolved in anhydrous THF (25 mL) and stirred under \( \text{N}_2 \) (g). The reaction mixture was cooled to \( 0^\circ \text{C} \) and then a 3.0 \( \text{N} \) solution of methyl magnesium chloride in THF (1.2 mL, 3.62 mmol) was added. The reaction mixture was stirred overnight at RT. Acetic acid (1.5 mL) was added to quench the reaction and then the mixture was concentrated under reduced pressure. The residue was redissolved in \( \text{CH}_2\text{Cl}_2 \) and subjected to a plug of silica gel eluting with 0 to 80% EtOAc in hexanes. The crude product (0.452 g) was then used in the next reaction without further purification. LCMS \( m/z \) 569 [M+H].

[0350] The crude methyl nucleoside (0.452 g, 0.796 mmol) was dissolved in anhydrous CH₂Cl₂ (20 mL) and stirred under N₂(g). Methanesulfonic acid (0.2 mL, 2.78 mmol) was added and the reaction stirred for 12 hr at RT. Et₃N (0.56 mL) was added to quench the reaction and then the mixture concentrated under reduced pressure. The residue was subjected to silica gel chromatography eluting with 0 to 75% EtOAc in Hexanes to yield the product as a mixture of anomers (0.20 g, 46% over 2 steps). LCMS m/z 551 [M+H].

[0351] The tribenzyl nucleoside (0.20 g, 0.364 mmol) was dissolved in AcOH (30 mL), and charged with Pd/C (Degussa) (400 mg). The stirred mixture was flushed with N₂(g) three times and then H₂ (g) was introduced. The reaction was stirred under H₂ (g) for 2 h, and then the catalyst removed by filtration. The solution was concentrated under reduced pressure and under the residue was re-dissolved in H₂O. The solution was subjected to preparative HPLC under neutral conditions to provide the α-anomer and β-anomer 14 in 81% yield. [0358] The preparation of (2S)-ethyl 2-(((2R,3S,4R,5R)-5-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxytetrahydrofuran-2-yl)methoxy)(phenoxy)phosphoryl)amino)-3-phenylpropanoate is described below.

**Preparation of (S)-ethyl 2-aminoo-3-phenylpropanoate hydrochloride.**
[0359] L-Phenylalanine (5 g, 30 mmol) was taken up in EtOH (30 mL). TMSCl (6.915 mL, 54 mmol) was added to the reaction at RT. The reaction vessel was fitted with a reflux condenser and the reaction was placed in an 80 °C bath. The reaction was stirred overnight. The next day the reaction was cooled to RT, concentrated under reduced pressure and the resulting residue was taken up in Et₂O. The resulting slurry was filtered and the isolate solids were further washed with Et₂O. The washed solids were placed under high vacuum to yield example (S)-ethyl 2-amino-3-phenylpropanoate hydrochloride (6.86 g, 99%). 1H NMR (400 MHz, DMSO-d₆) δ 8.52 (s, 3H), 7.30 (m, 5H), 4.24 (ABX, Jₓₓ = 7.8 Hz, Jₓᵧ = 6.2 Hz, 1H), 4.11 (m, 2H), 3.17, 3.05 (ABX, Jₓᵧ = -14 Hz, Jᵧᵧ = 5.8 Hz, Jₓₓ = 7.6 Hz, 2H), 1.09 (s, J = 6.8 Hz, 3H).

Preparation of (2S)-ethyl 2-(((4-nitrophenoxy)(phenoxy)phosphoryl)amino)-3-phenylpropanoate (Compound D)

[0360] (S)-ethyl 2-amino-3-phenylpropanoate hydrochloride (1.01 g, 4.41 mmol) was dissolved in DCM (50 mL). This solution was cooled to 0 °C and PhOP(O)Cl₂ (0.656 mL, 4.41 mmol) was added, followed by the slow addition of Et₃N (1.62 mL, 11.5 mmol) over 5 min. The cold bath was removed and the reaction was allowed to warm to RT and stir over a period of 80 min. p-NO₂PhOH (0.583 g, 4.19 mmol) was added, followed by more Et₃N (0.3 mL, 2.1 mmol). The reaction progress was monitored by LC/MS. Upon completion of the reaction, it was diluted with Et₂O, and the resulting solids were removed by filtration. The filtrate was concentrated and compound D (1.25 g, 60%, as a mixture of diastereomers) was isolated by silica gel column chromatography (25 g dry load cartridge, 120 g column; eluent: 100% hexanes ramping to 55% EtOAc in hexanes). 1H NMR (400 MHz, CD₃OD) δ 8.17 (m, 2H), 7.33 (m, 2H), 7.09-7.25 (m, 10H), 4.17 (m, 1H), 4.07 (m, 2H), 3.08 (m, 1H), 2.84 (m, 1H), 1.14 (m, 3H). 31P NMR (162 MHz, DMSO-d₆) δ -1.479 (s), -1.719 (s). Preparation of Ethyl 2-((tert-butoxycarbonyl)amino)-2-methylpropanoate

Take up triphenylphosphine (6.18g, 25.00mmol) in THF (30mL). Next charge DIAD (4.92mL, 25.00mmol) and stir at room temperature for 10min. Dissolve 2-((tert-butoxycarbonyl)amino)-2-methylpropanoic acid (5.08g, 25.00mmol) in THF (20mL) and add to the reaction mixture followed by the addition of ethanol (2.19mL, 37.49mmol). Allow the reaction to stir at room temperature for 1h. The solvents were removed under reduced pressure and the crude was taken up in 1:1 Et₂O:Hexanes (120mL). The solid triphenylphosphine oxide was filtered off and the solvent was removed under reduced pressure. The crude was taken up in minimal CH₂Cl₂ and purified by silica gel chromatography 0-50% EtOAc/Hex to afford ethyl 2-((tert-butoxycarbonyl)amino)-2-methylpropanoate (2.71g, 47%). ¹H NMR (400 MHz, Chloroform-d) δ 4.18 (q, J = 7.1 Hz, 2H), 1.49 (s, 6H), 1.43 (s, 9H), 1.27 (t, J = 7.1 Hz, 3H).

Preparation of Ethyl 2-amino-2-methylpropanoate hydrochloride

Take up ethyl 2-((tert-butoxycarbonyl)amino)-2-methylpropanoate (2.71g, 11.72mmol) in CH₂Cl₂ (25mL) and slowly add 4N HCl in dioxane (25mmol) and stir at room temperature. At 1h, the reaction was determined to be complete by TLC. The solvents were removed under reduced pressure and the crude was coevaporated with Et₂O two times then placed under high vacuum to afford ethyl 2-amino-2-methylpropanoate hydrochloride (2.02g, 102%). ¹H NMR (400 MHz, DMSO-d₆) δ 8.70 (s, 3H), 4.18 (q, J = 7.1 Hz, 2H), 1.46 (s, 6H), 1.21 (t, J = 7.1 Hz, 3H).

Preparation of Ethyl 2-methyl-2-(((4-nitrophenoxy)(phenoxy)phosphoryl)amino)propanoate
(Compound N)
Take up phenyl dichlorophosphate (0.97mL, 6.50mmol) and ethyl 2-amino-2-methylpropanoate hydrochloride (1.09g, 6.50mmol) in CH\textsubscript{2}Cl\textsubscript{2} (50mL). Cool the reaction mixture to 0 °C and slowly add TEA (1.75mL, 12.45mmol). Remove the cold bath and allow the reaction mixture to stir at room temperature. After 2h, the addition of the amino acid was determined to be complete by \textsuperscript{31}P NMR. Charge p-nitrophenol (0.860g, 6.17mmol) followed by the addition of TEA (0.87, 7.69mmol). Allow the reaction to stir at room temperature. After 2h, the reaction was determined to be complete by LCMS. The reaction was diluted with Et\textsubscript{2}O and the TEA-HCl salts were filtered off. The crude was concentrated and purified by silica gel chromatography (0-50% EtOAc/Hex) to afford compound N (1.79g, 68%). \textsuperscript{1}H NMR (400 MHz, DMSO-\textsubscript{d\textsubscript{6}}) \delta 8.37 – 8.21 (m, 2H), 7.55 – 7.44 (m, 2H), 7.43 – 7.33 (m, 2H), 7.30 – 7.09 (m, 3H), 6.57 (d, J = 10.1 Hz, 1H), 3.99 (q, J = 7.1 Hz, 2H), 1.39 (s, 6H), 1.08 (t, J = 7.1 Hz, 3H). \textsuperscript{31}P NMR (162 MHz, DMSO-\textsubscript{d\textsubscript{6}}) \delta -2.87. [0392] The preparation of (S)-2-ethylbutyl 2-(((S)-(((2R,3S,4R,5R)-5-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-5-cyano-3,4-dihydroxytetrahydrofuran-2-yl)methoxy)(phenoxy)phosphoryl)amino)propanoate is described below.

Preparation of (3R,4R,5R)-3,4-bis(benzyloxy)-5-((benzyloxy)methyl)tetrahydrofuran-2(3H)-one.

[0393] (3R,4R,5R)-3,4-bis(benzyloxy)-5-((benzyloxy)methyl)tetrahydrofuran-2-ol (15.0 g) was combined with MTBE (60.0 mL), KBr (424.5 mg), aqueous K₂HPO₄ solution (2.5M, 14.3 mL), and TEMPO (56 mg). This mixture was cooled to about 1 °C. Aqueous bleach solution (7.9% wt.) was slowly charged in portions until complete consumption of starting material as indicated through a starch/iodide test. The layers were separated, and the aqueous layer was extracted with MTBE. The combined organic phase was dried over MgSO₄ and concentrated under reduced pressure to yield the product as a solid.

Preparation (4-amino-7-iodopyrrolo[2,1-f][1,2,4]triazine)

[0394] To a cold solution of 4-aminopyrrolo[2,1-f][1,2,4]-triazine (10.03 g; 74.8 mmol) in N,N-dimethylformamide (70.27 g), N-iodosuccinimide (17.01 g; 75.6 mmol) was charged in portions, while keeping the contents at about 0 °C. Upon reaction completion (about 3 h at about 0 °C), the reaction mixture was transferred into a 1 M sodium hydroxide aqueous solution (11 g NaOH and 276 mL water) while keeping the contents at about 20-30 °C. The
resulting slurry was agitated at about 22 °C for 1.5 h and then filtered. The solids are rinsed with water (50 mL) and dried at about 50 °C under vacuum to yield 4-amino-7-iodopyrrolo[2,1-f][1,2,4]triazine as a solid. $^1$H NMR (400 MHz, DMSO-d6) δ 7.90 (s, 1H), 7.78 (br s, 2H), 6.98 (d, J = 4.4 Hz, 1H), 6.82 (d, J = 4.4 Hz, 1H). $^{13}$C NMR (101 MHz, DMSO-d6) δ 155.7, 149.1, 118.8, 118.1, 104.4, 71.9. Preparation (3R,4R,5R)-2-(4-aminopyrrolo[2,1-f][1,2,4]triazin-7-yl)-3,4-bis(benzyloxy)-5-((benzyloxy)methyl)tetrahydrofuran-2-ol via (4-amino-7-iodopyrrolo[2,1-f][1,2,4]triazine)

[0395] To a reactor under a nitrogen atmosphere was charged iodobase 2 (81 g) and THF (1.6 LV). The resulting solution was cooled to about 5 °C, and TMSCl (68 g) was charged. PhMgCl (345 mL, 1.8 M in THF) was then charged slowly while maintaining an internal temperature at about ≤ 5°C. The reaction mixture was stirred at about 0°C for 30 min, and then cooled to about -15 °C. iPrMgCl-LiCl (311 mL, 1.1 M in THF) was charged slowly while maintaining an internal temperature below about -12 °C. After about 10 minutes of stirring at about -15 °C, the reaction mixture was cooled to about -20 °C, and a solution of lactone 1 (130 g) in THF (400 mL) was charged. The reaction mixture was then agitated at about -20 °C for about 1 h and quenched with AcOH (57 mL). The reaction mixture was warmed to about 0 °C and adjusted to pH 7-8 with aqueous NaHCO$_3$ (5 wt%, 1300 mL). The reaction mixture was then diluted with EtOAc (1300 mL), and the organic and aqueous layers were separated. The organic layer was washed with 1N HCl (1300 mL), aqueous NaHCO$_3$ (5 wt%, 1300 mL), and brine (1300 mL), and then dried over anhydrous Na$_2$SO$_4$ and concentrated to dryness. Purification by silica gel column chromatography using a gradient consisting of a mixture of MeOH and EtOAc afforded the product.

Preparation of Title Compound (mixture of Sp and Rp):

[0397] The nucleoside (29 mg, 0.1 mmol) and the phosphonamide (60 mg, 0.12 mmol) and N,N-dimethylformamide (2 mL) were combined at ambient temperature. Tert-Butyl magnesium chloride (1M in THF, 0.15 mL) was slowly added. After about 1h, the reaction was diluted with ethyl acetate, washed with aqueous citric acid solution (5%wt.), aqueous saturated NaHCO$_3$ solution and saturated brine solution. The organic phase was dried over Na$_2$SO$_4$ and concentrated under reduced pressure. The residue was purified by silica gel column chromatography using a gradient of methanol and CH$_2$Cl$_2$ (0 to 5%). Product containing fractions were concentrated under reduced pressure to provide the product.
Preparation of (3αR,4R,6R,6αR)-4-(4-aminopyrrolol[2,1-f][1,2,4]triazin-7-yl)-6-(hydroxymethyl)-2,2-dimethyltetrahydrofurano[3,4-d][1,3]dioxole-4-carbonitrile:

[0398] To a mixture of (2R,3R,4S,5R)-2-(4-aminopyrrolol[2,1-f][1,2,4]triazin-7-yl)-3,4-dihydroxy-5-(hydroxymethyl)tetrahydrofuran-2-carbonitrile (5.8 g, 0.02 mol), 2,2-dimethoxypropane (11.59 mL, 0.09 mol) and acetone (145 mL) at ambient temperature was added sulfuric acid (18M, 1.44 mL). The mixture was warmed to about 45 °C. After about 30 min, the mixture was cooled to ambient temperature and sodium bicarbonate (5.8 g) and water 5.8 mL) were added. After 15 min, the mixture was concentrated under reduced pressure. The residue was taken up in ethyl acetate (150 mL) and water (50 mL). The aqueous layer was extracted with ethyl acetate (2 x 50 mL). The combined organic phase was dried over sodium sulfate and concentrated under reduced pressure to give crude (2R,3R,4S,5R)-2-(4-aminopyrrolol[2,1-f][1,2,4]triazin-7-yl)-3,4-dihydroxy-5-(hydroxymethyl)tetrahydrofuran-2-carbonitrile. 1H NMR (400 MHz, CD3OD) δ 7.84 (s, 1H), 6.93 (d, J = 4.6 Hz, 1H), 6.89 (d, J = 4.6 Hz, 1H), 5.40 (d, J = 6.7 Hz, 1H), 5.00 (dd, J = 6.7, 3.3 Hz, 1H), 4.48 – 4.40 (m, 1H), 3.81 – 3.72 (m, 2H), 1.71 (s, 3H), 1.40 (s, 3H). [0400] The crude acetonide (12.85 g) was combined with tetrahydrofuran (50 mL) and concentrated under reduced pressure. The residue was taken up in tetrahydrofuran (100 mL), cooled to about 0 °C and concentrated HCl (20 mL) was slowly added. The mixture was allowed to warm to ambient temperature. After consumption of the starting acetonide as indicated by HPLC analysis, water (100 mL) was added followed by aqueous saturated sodium bicarbonate solution (200 mL). The mixture was extracted with ethyl acetate (100 mL), the organic phase washed with aqueous saturated brine solution (50 mL), dried over sodium sulfated and concentrated under reduced pressure. The residue was purified by silica gel column chromatography using a gradient of methanol and ethyl acetate (0 to 20%).
Product containing fractions were concentrated under reduced pressure to provide the product.

B. Antiviral Activity

[0401] Another aspect of the invention relates to methods of inhibiting viral infections, comprising the step of treating a sample or subject suspected of needing such inhibition with a composition of the invention.

[0402] Within the context of the invention samples suspected of containing a virus include natural or man-made materials such as living organisms; tissue or cell cultures; biological samples such as biological material samples (blood, serum, urine, cerebrospinal fluid, tears, sputum, saliva, tissue samples, and the like); laboratory samples; food, water, or air samples; bioproduct samples such as extracts of cells, particularly recombinant cells synthesizing a desired glycoprotein; and the like. Typically the sample will be suspected of containing an organism which induces a viral infection, frequently a pathogenic organism such as a tumor virus. Samples can be contained in any medium including water and organic solvent/water mixtures. Samples include living organisms such as humans, and man made materials such as cell cultures.

[0403] If desired, the anti-virus activity of a compound of the invention after application of the composition can be observed by any method including direct and indirect methods of detecting such activity. Quantitative, qualitative, and semiquantitative methods of determining such activity are all contemplated. Typically one of the screening methods described above are applied, however, any other method such as observation of the physiological properties of a living organism are also applicable.

[0404] The antiviral activity of a compound of the invention can be measured using standard screening protocols that are known. For example, the antiviral activity of a compound can be measured using the following general protocols:

**Example 36. Lassa virus and Junin virus antiviral activity and cytotoxicity assays**

[0405] Antiviral activity of Compound 1, Compound 9, and Compound 32 was measured against Lassa virus (LASV) and Junin virus (JUNV). All studies conducted with wild-type virus were performed in biosafety level-4 containment (BSL-4) at the US Army Medical Research Institute for Infectious Diseases (USAMRIID). Antiviral Assays conducted with an attenuated strain of JUNV were conducted at Utah State University in a BSL-2 laboratory. Lassa virus antiviral assays were conducted HeLa cells. Junin virus antiviral assays were conducted in Vero and HeLa cells.

[0406] Antiviral assays were conducted in 384 or 96 well plates in BSL-4 containment using a high content imaging system to quantify virus antigen production as a measure of virus replication. A “no virus” control (Column 2) and a “1% DMSO” control (Column 3) were included on each plate to determine the 0% and 100% virus replication signal, respectively. The primary antibodies used for detection of viral antigens were mm L52-161-6 anti-GP; LASV and mm Y-GQC03_BF11 anti-GP, JUNV and DyLight 488 anti-mouse-IgG was used as the secondary detection antibody. The primary antibody was diluted 1000-fold in blocking buffer (1xPBS with 3% BSA) and added to each well of the assay plate. The assay plates were incubated for 60 minutes at room temperature. The primary antibody was removed and the cells were washed 3 times with 1xPBS. The secondary antibody was diluted 1000-fold in blocking buffer and was added to each well in the assay plate. The assay plates were incubated for 60 minutes at room temperature. Nuclei were stained using Draq5 (Biostatus, Shepshed Leicestershire, UK, Cat# DR05500) diluted in 1xPBS. Cell images were acquired using Perkin Elmer Opera confocal microscope (Perkin Elmer, Waltham, MA) using 10x air objective to collect five images per well. Virus-specific antigen was quantified by measuring fluorescence emission at a 488nm wavelength and the nuclei were quantified by measuring fluorescence emission at a 640nm wavelength. The Z’ values for all antiviral assays were > 0.3.

[0407] The percentage inhibition was calculated for each tested concentration relative to the 0% and 100% inhibition controls and the EC₅₀ value for each compound was determined by non-linear regression as the effective concentration of compound that inhibited virus replication by 50%.
**Example 37. Junin Virus Assay - Vero**

[0408] Vero or Vero E6 cells were seeded in 96 well plates at 20,000 cells per well in 100 uL of MEM+2% FBS. Compounds diluted in DMSO were mixed with 120 uL of MEM+2% FBS. 100 uL of each test compound are transferred to 2 wells of a 96-well plate. 20 uL of virus solution in MEM+20% FBS are added so that final test concentrations are 47, 4.7, 0.47, 0.047 μM and the multiplicity of infection was 0.003 pfu / cell. Test plates were incubated until untreated virus controls approached maximum cytopathic effects (CPE) (5 to 7 days). Plates are then stained with neutral red dye for 2 hrs then eluted in Citrate/Ethanol buffer and read on a spectrophotometer at 540 nm. EC50 value is calculated by regression analysis as the concentration of test compound required to reduce viral-induced CPE by 50% measured by neutral red staining.

**Example 38. Junin Virus Assay - HeLa**

[0409] HeLa cells were seeded at 2000 cells per well in a 384 well plate and compounds were added to the assay plates as described in section 3.2.1. Assay plates were transferred to the BSL-4 suite and infected with 0.3 pfu per cell JUNV which resulted in ~50% of the cells expressing virus antigen in a 48h period. The assay plates were incubated for 48h and virus replication was quantified by immuno-staining using antibodies that recognized the viral glycoproteins.

**Example 39. Lassa Virus Assay**

[0410] HeLa cells were seeded at 2000 cells per well in a 384 well plate and compounds were added to the assay plates as described in section 3.2.1. Assay plates were transferred to the BSL-4 suite and infected with 0.1 pfu per cell LASV which resulted in >60% of the cells expressing virus antigen in a 48h period. The assay plates were incubated for 48h and virus replication was quantified by immuno-staining using antibodies that recognized the viral glycoproteins.

**Example 40. MERS-CoV and SARS-CoV antiviral activity and cytotoxicity assays**

[0411]  Antiviral activity of Compound 9 and Compound 32 was measured against MERS virus (MERS-CoV) and SARS virus (SARS-CoV).

[0412]  Antiviral assays were conducted at USAMRIID and the University of North Carolina at Chapel Hill.

**Example 41. MERS-CoV antiviral assay (USAMRIID)**

[0413]  Vero E6 cells seeded in 384-well plates and serial dilutions of Comound 32 or Compound 9 were added to the assay plates by direct titration using an HP D300 Digital Dispenser (Hewlett-Packard, Palo Alto, CA). The plates were transferred to the BSL-4 suite and infected with MERS-CoV (Strain Jordan N3) at a multiplicity of infection of 0.5 plaque forming unit (pfu) per cell. The infected cultures were incubated for 48 hours. The level of virus replication in compound-treated and control vehicle-treated cultures was determined by quantifying the level of virus-specific antigen following immuno-staining with antibody against the MERS-CoV spike (S) protein. The primary antibody (40069-RP02 rb - HCoV-EMC/2012 spike(S) protein) was diluted 1000-fold in blocking buffer (1x phosphate buffered saline (PBS) with 3% BSA) and added to each well of the assay plate. The assay plates were incubated for 60 minutes at room temperature. The primary antibody was removed and the cells were washed 3 times with 1x PBS. The secondary detection antibody was an anti-rabbit IgG conjugated with Dylight488 (Thermo Fisher Scientific, Waltham, MA, Cat# 405310). The secondary antibody was diluted 1000-fold in blocking buffer and was added to each well in the assay plate. The assay plates were incubated for 60 minutes at room temperature. Nuclei were stained using Draq5 (Biostatus, Shepshed Leicestershire, UK, Cat# DR05500) diluted in 1x PBS. The cells were counter-stained with CellMask Deep Red (Thermo Fisher Scientific, Waltham, MA, Cat# C10046) to enhance detection of the
cytoplasm compartment. Cell images were acquired using Perkin Elmer Opera confocal microscope (Perkin Elmer, Waltham, MA) using 10x air objective to collect 5 images per well. Virus-specific antigen was quantified by measuring fluorescence emission at a 488nm wavelength and the nuclei were quantified by measuring fluorescence emission at a 640nm wavelength. High content image analysis was performed to quantify the percent of infected cells and cell viability. Analysis of dose response to determine EC50 values was performed using GeneData Screener software applying Levenberg-Marquardt algorithm for curve fitting strategy.

Example 42. MERS-CoV and SARS-CoV antiviral assay

[0414] HAE cell cultures isolated from lung tissue were cultured for 6 weeks at the air liquid interface to promote differentiation. The apical surfaces of the HAE cultures were washed at 24 h and 1 h prior to infection with 1x PBS for >1 hour at 37°C. Recombinant MERS-CoV expressing red fluorescent protein (MERS-CoV RFP) and SARS-CoV expressing green fluorescent protein (SARS-CoV GFP) were used to apically infect the differentiated HAE cultures at a multiplicity of infection of 0.1 pfu per cell. To infect the HAE cultures, apical washes were removed, viral inoculum was added, and inoculated cultures were incubated at 37°C for 2.5 hours. The inoculum was removed, and the apical surfaces of the HAE cultures were washed 3 times with 500μL of 1x PBS to remove residual virus. Five 3-fold serial dilutions of Compound 9 starting at 10 μM were prepared in triplicate and added to HAE ALI media on the basolateral side of the culture approximately 30 minutes prior to infection. Virus replication was assessed by fluorescence imaging of cell cultures following a 48-hour incubation. In addition, virus replication was quantified by measuring the production of infectious virus in HAE apical washes by plaque assay on Vero cell monolayers and by quantifying viral RNA production from total cell RNA by real-time PCR assay.

Example 43. MERS-CoV and SARS-CoV real-time PCR assay

[0415] At 48 hours post-infection, primary HAE cultures from the antiviral assay described above were harvested in 500 µL TRIzol. RNA was purified using a Direct-zol RNA MiniPrep kit (Zymo Research Corporation, Irvine, CA, USA). First-strand cDNA was generated for each sample using SuperScript III (Life Technologies, Grand Island, NY, USA) with incubation at 55°C. Following first-strand cDNA generation, ORF1 (genome RNA) and ORF8 or ORF9 (MERS-CoV and SARS-CoV subgenomic RNA, respectively) were quantified by real-time PCR using the following primers: MERS-CoV: Leader Forward (5’-GAA TAG CTT GGC TAT CTC AC -3’), ORF1 Reverse (5’-CAC AAT CCC ACC AGA CAA -3’), ORF8 Reverse (5’-TTG TTA TCG GCA AAG GAA AC -3’); and SARS-CoV: Leader Forward (5’-AGC CAA CCA ACC TCG ATC TCT TGT -3’), ORF1 Reverse (5’-TGA CAC CAA GAA CAA GGC TCT CCA -3’), ORF9 Reverse (5’-ATT GGT GTT GAT TGG AAC GCC CTG -3’). Reads were normalized to GAPDH using the following primers: GAPDH Forward (5’-TGC ACC ACC AAC TGC TTA GC -3’) and GAPDH Reverse (5’-GGC ATG GAC TGT GGT CAT GAG -3’). Results are expressed as log₁₀ fold changes in viral ORF1 and ORF8-encoding RNA (MERS-CoV) / and ORF9-encoding RNA (SARS-CoV) copy number in treated versus untreated cells using the ΔΔCt method \{10431\}.

Example 44. In vitro efficacy in Calu-3 2B4 Cells

[0416] At 48 hrs prior to infection, Calu-3 2B4 cells were plated in a 96-well black walled clear bottom plate at 5 × 10^4 cells/well. 24-hr prior to infection, culture medium was replaced. A 20 mM stock of Compound 32 was serially diluted in 100% DMSO in 3-fold increments to obtain a ten-point dilution series. MERS-nLUC was diluted in DMEM 10% FBS, and 1% antibiotics/antimycin to achieve a multiplicity of infection (MOI) of 0.08. Cells were infected in triplicate per drug dilution for 1 hr after which, virus was aspirated, cultures were rinsed once and fresh medium containing drug or vehicle was added. At 48 hrs post infection, virus replication was quantitated on a Spectramax (Molecular Devices) plate reader via nanoluciferase assay (Promega) according to the manufacturer’s protocol. For our 100% inhibition control, diluted MERS-nLUC was exposed to short-wave UV light (LLC, Upland, CA) for 6 minutes to inhibit the ability of the virus to replicate. For our 0% inhibition control, cells were infected in the presence of vehicle. DMSO was kept constant in all conditions at 0.05% by volume (v/v). Values from triplicate wells per condition were averaged and compared to controls to generate a percent inhibition value for each drug dilution. The EC_{50} value was defined as the concentration at which there was a 50% decrease in viral replication. Data were analyzed using GraphPad Prism 6.0 (La Jolla, CA). The EC_{50} and CC_{50} values were calculated by non-linear regression analysis using the dose-response (variable slope) equation (four parameter logistic equation): \( Y = \text{Bottom} + (\text{Top}-\text{Bottom})/(1+10^{(\text{LogEC}_{50}-X)^\text{HillSlope}}) \). The “Bottom” and “Top” values are defined by the minimum and maximum Y values. Hill slope is a parameter used to define the steepness of a dose-response curve. EC_{50} and CC_{50} values were calculated as an average of two to four independent experiments.

**Example 45. Evaluation of Subcutaneous Compound 32 against Severe Acute Respiratory Syndrome Coronavirus (SARS-CoV) in Esterase Deficient (Ces1c−/−) Mice**

[0417] Male and female mice (25-28 week) genetically deleted for carboxylesterase 1C (Ces1c−/−) (Jackson Laboratories stock 014096). The (Ces1c−/−) mice were used since rodents express high levels of carboxylesterase activity in plasma relative to other animal species reducing the plasma half-life of Compound 32. Genetic deletion of carboxylesterase 1C improved the plasma stability of Compound 32 generating pharmacokinetic profiles similar to those observed in humans and other animal species.

[0418] The study design is captured in Table 4. Efficacy studies were performed in an animal biosafety level 3 (ABSL3) facility. All work was conducted under protocols approved by the Institutional Animal Care and Use Committee at UNC Chapel Hill according to guidelines set by the Association for the Assessment and Accreditation of Laboratory Animal Care (AAALAC) and the United States Department of Agriculture (USDA).

[0419] Groups 1 (vehicle), Group 2 (Compound 32 BID 25 mg/kg), and Group 3 (Compound 32 QD 50 mg/kg) were anaesthetized with ketamine/xyazine exposed to $10^4$ pfu of SARS-CoV/50ul via the intranasal route. Group 4 (Vehicle) and Group 5 (Compound 32 BID 25 mg/kg) remained uninfected and were used as controls for whole body plethysmography evaluations. Vehicle comprised 12% sulfobutylether-β-cyclodextrin in water (with HCl/NaOH) at pH 5.0). On day 0, animals were exposed to virus. On days 2 and 5 post infection, groups of animals were euthanized by isofluorane overdose and the large left lobe of the lung was placed in a 2 mL screw cap tube with 1 mL DPBS with glass beads and frozen at -80 °C until analyzed by plaque assay. The inferior right lobe was placed in 10% buffered formalin and stored at 4 °C until histological analysis.

[0420] Changes in lung function were determined by whole body plethysmography (WBP, Buxco lung function testing system, Data Sciences International). After a 30-minute acclimation in the plethysmograph chamber, 11 respiratory responses and several quality control metrics were continually measured every 2-second for 5 minutes for a total of 150 data points. Mean values for each parameter were determined within DSI Finepoint software.

[0421] Histological analysis was performed on formalin fixed samples and paraffin embedded tissues with 5µm. To assess lung pathology, sections were stained with hematoxylin and eosin. Viral antigen in the lung was stained using polyclonal antinucleocapsid antibody (Imgenex). Slides were blinded to the evaluator and assessed for virus associated lung pathology as well as spatial location and prevalence of viral antigen. Images were captured using an Olympus BX41 microscope equipped with an Olympus DP71 camera.

[0422] Viral plaque assay was used to quantify infectious virus from frozen lung tissue. Vero E6 cells were seeded in 6-well plates at 5 x $10^5$ cells /well. Lung tissue was thawed, homogenized via Roche Magnalyzer, and the tissue suspension was serially diluted and the dilutions used to infect the Vero E6 cells. At 72 h post-infection, the plates were fixed and stained and the number of plaques quantified by visual inspection.

[0423] The primary endpoint for this study was viral load in lung tissue at Day 5 post-infection. Additional endpoints included changes in animal body weight and lung function.
Animal body weight was recorded daily for the duration of the in-life phase. On day -1, 1, 2, 3, and 5 after inoculation, whole body plethysmography was performed to assess lung function. On Day 5, a scheduled necropsy was performed on all remaining animals; gross lung pathology was evaluated by a board-certified veterinary pathologist. Lung tissue was collected for histopathological and virological analysis.

[0424] **Body Weight and Viral Load:** Changes in body weight and tissue viral load for each study group at Day 5 are shown in Figures 1, 2A and 2B. As shown in Figure 1, animals treated with Compound 32 displayed no evidence of weight loss associated with SARS-CoV infection compared to vehicle-treated animals. Infectious virus was measured in lung tissue collected at necropsy by plaque assay. As shown in Figures 2A and 2B, infectious virus was significantly decreased in Compound 32-treated animals at Day 2 and Day 5 post-infection relative to vehicle-treated animals. These data suggest that Compound 32 reduces replication of SARS-CoV in the lung.

[0425] **Lung Function Measurements:** The effect of Compound 32 treatment on pulmonary function in SARS-CoV infected mice was evaluated by whole body plethysmography (WBP) (Figures 3A-F). WBP showed an increase in Penh values in vehicle treated mice suggesting that virus replication in the lung increased airway resistance. In animals treated with either 25 mg/kg of Compound 32 twice per day or 50 mg/kg of Compound 32 once per day, Penh values were lower compared to vehicle-treated animals and were more similar to mock-infected animals.

[0426] In vehicle-treated mice infected with SARS-CoV the length of time to release a breath (Expiration Time) or time between breaths (End Expiratory Pause) measured by WBP increased indicating labored breathing. As shown in Figures 3A-F, these breathing parameters were reduced in Compound 32-treated animals approaching values obtained from mock-infected animals.

**Example 46. A Blinded, Randomized, Vehicle-Controlled Evaluation of Intravenous Compound 32 against Middle East Respiratory Syndrome Coronavirus (MERS-CoV) in Rhesus Monkeys**
MERS-CoV isolate HCoV-EMC/2012 was used for the challenge virus at the Test Facility. MERS-CoV isolate HCoV-EMC/2012 was provided by the Viroscience Laboratory, Erasmus Medical Center, Rotterdam, The Netherlands, and propagated in VeroE6 cells in DMEM (Sigma) supplemented with 2% (vol/vol) FCS (Logan), 1 mM L-glutamine (Lonza), 50 U/mL penicillin, and 50 μg/mL streptomycin (Gibco). Experimentally naïve male rhesus monkeys were randomly assigned to treatment groups and balanced by body weight.

The study design is captured in Table 5.

All animals were exposed to a target dose of $7 \times 10^6$ plaque forming units MERS-CoV virus diluted in 0.9% sodium chloride for inoculation. The animals were inoculated by multiple routes that included intranasal, ocular, and intratracheal administration. The day on which animals were challenged was designated as Day 0.

Methods to control bias included experimental blinding. Specifically, study personnel who administered Compound 32 or vehicle treatments or routinely evaluated animal health were experimentally blinded to the group assignment of all animals for the duration of the in-life phase. Unblinded personnel, who were not responsible for evaluating animal health, prepared individual doses from bulk ready-to-use formulations provided by the Sponsor. Vehicle and Compound 32 formulations were identical in physical appearance.

In Groups 1 and 2, once-daily vehicle treatment was administered for 7 days beginning on Day -1 (one day prior to virus exposure). Each dose of Compound 32 or vehicle was administered as a single bolus slow IV injection in the saphenous vein at a volume of 2.0 mL/kg body weight over the course of 1 to 2 min. Doses were administered to animals anesthetized using IM injection of a solution containing ketamine (100 mg/mL) and acepromazine (10 mg/mL) at a volume of 0.1 mL/kg body weight. The weight of each animal was obtained on Day -7, and these weights were used for dose volume determination for all administered doses of Compound 32 or vehicle.
[0432] The primary endpoint for this study was viral load in lung tissue at Day 6 post-infection. Animal health was monitored at least twice daily for the duration of the in-life phase and clinical disease signs were recorded. On day -7, 0, 1, 3, 5 and 6 after inoculation, clinical exams were performed on all animals to determine bodyweight, body temperature, respirations/minute (under anesthesia), and to collect x-rays, nose and throat swabs. Whole blood and serum were collected for hematology, biochemistry and cytokine analysis. On Day 6, a scheduled necropsy was performed on all animals; gross lung pathology was scored (as % of lung lobe affected by gross lesions) by a board-certified veterinary pathologist and lung weight was recorded to determine the lung weight/body weight ratio. Nineteen tissues were collected for histopathological and virological analysis.

[0433] Disease signs in vehicle-treated animals were attributed to MERS-COV infection. Cumulative clinical scores were notably higher in vehicle-treated animals compared to Compound 32-treated animals. These disease symptoms were less pronounced in the Compound 32-treated animals.

[0434] **Body Weight and Viral Load**: Changes in body weight, temperature and respiration are shown in Figures 4A-C. The body weight and body temperature did not change appreciably during the course of the infection in the presence or absence of Compound 32 treatment. Respiration rates increased over the course of infection and tended to be higher at Day 6 in vehicle-treated animals compared to Compound 32-treated animals.

[0435] **Tissue Viral Load**: Viral RNA was measured in lung tissue and other organs collected at necropsy. Changes in tissue viral RNA concentrations for each study group at Day 6 are shown in Figure 5. Virus was detected in all respiratory tract tissues in vehicle-treated animals. Viral RNA in the respiratory tract was significantly reduced in Compound 32-treated animals. Viral RNA was below the limit of detection in treated and untreated animals in the liver, spleen, kidney and bladder tissue. Viral RNA was detected in all animals in the mediastinal lymph node, but in only one vehicle-treated animal in the mandibular lymph node.

[0436] Virus was detected in nose swabs and throat swabs at Day 1, 3, 5 and 6 post-infection. There was no difference in viral load between vehicle-treated and Compound 32-treated
animals. Viral RNA was detected in one vehicle-treated animal in the urine collected at Day 6. The changes in white blood cell counts, neutrophils and lymphocytes are shown in Figure 5.

each n is independently 0, 1, or 2; and
wherein each (C\textsubscript{1}–C\textsubscript{8})alkyl, (C\textsubscript{2}–C\textsubscript{8})alkenyl, (C\textsubscript{2}–C\textsubscript{8})alkynyl or (C\textsubscript{6}–C\textsubscript{20})aryl(C\textsubscript{1}–C\textsubscript{8})alkyl of each R\textsuperscript{2}, R\textsuperscript{3}, R\textsuperscript{5}, R\textsuperscript{6}, R\textsuperscript{11} or R\textsuperscript{12} is, independently, optionally substituted with one or more halo, hydroxy, CN, N\textsubscript{3}, N(R\textsuperscript{a})\textsubscript{2} or OR\textsuperscript{a}; and wherein one or more of
the non-terminal carbon atoms of each said (C₁₋₈)alkyl may be optionally replaced with -O-, -S- or -NRᵃ⁻.

2. The method of claim 1 wherein the compound is a compound of Formula IV:

![Formula IV](image)

or a pharmaceutically acceptable salt or ester, thereof;

wherein:

R⁷ is selected from the group consisting of

a) H, -(C=O)R¹¹, -C(=O)OR¹¹, -C(=O)NR¹¹R¹², -C(=O)SR¹¹, -S(O)R¹¹, -S(O)₂R¹¹, -S(O)(OR¹¹), -S(O)₂(OR¹¹), or -SO₂NR¹¹R¹²,

wherein each R¹¹ or R¹² is independently H, (C₁₋₈)alkyl, (C₂₋₈)alkenyl, (C₂₋₈)alkynyl, (C₄₋₈)carbocyclylalkyl, optionally substituted aryl, optionally substituted heteroaryl, -C(=O)(C₁₋₈)alkyl, -S(O)ₙ(C₁₋₈)alkyl or aryl(C₁₋₈)alkyl; or R¹¹ and R¹² taken together with a nitrogen to which they are both attached form a 3 to 7 membered heterocyclic ring wherein any one carbon atom of said heterocyclic ring can optionally be replaced with -O-, -S- or -NRᵃ⁻;

each Rᵃ is independently H, (C₁₋₈)alkyl, (C₂₋₈)alkenyl, (C₂₋₈)alkynyl, aryl(C₁₋₈)alkyl, (C₄₋₈)carbocyclylalkyl, -C(=O)R, -C(=O)OR, -
C(=O)NR₂, -C(=O)SR, -S(O)R, -S(O)₂R, -S(O)(OR), -S(O)₂(OR),
or -SO₂NR₂;

wherein each R is independently H, (C₁-C₈) alkyl, (C₁-C₈) substituted
alkyl, (C₂-C₈) alkenyl, (C₂-C₈) substituted alkenyl, (C₂-C₈) alkynyl,
(C₂-C₈) substituted alkynyl, C₆-C₂₀ aryl, C₆-C₂₀ substituted aryl,
C₂-C₂₀ heterocyclyl, C₂-C₂₀ substituted heterocyclyl, arylalkyl or
substituted arylalkyl; and

wherein each (C₁-C₈) alkyl, (C₂-C₈) alkenyl, (C₂-C₈) alkynyl or aryl(C₁-
C₈) alkyl of each R¹¹ or R¹² is, independently, optionally substituted
with one or more halo, hydroxy, CN, N₃, N(R³)₂ or ORⁿ; and

wherein one or more of the non-terminal carbon atoms of each said
(C₁-C₈) alkyl may be optionally replaced with -O-, -S- or -NRⁿ⁻².

b)

\[ \text{HO-PO-PO-PO-PO} \]

or

\[ \text{HO-PO-PO-PO-PO} \]

c)

wherein:

R² is selected from phenyl, 1-naphthyl, 2-naphthyl.
R^d is H or CH₃;

R^c₁ and R^c₂ are each independently H, C₁-C₆ alkyl or benzyl;

R^f is selected from H, C₁-C₈ alkyl, benzyl, C₅-C₆ cycloalkyl, and -CH₂-C₃-C₆ cycloalkyl;

R^g is selected from C₁-C₈ alkyl, -O-C₁-C₈ alkyl, benzyl, -O-benzyl, -CH₂-C₅-C₆ cycloalkyl, -O-CH₂-C₃-C₆ cycloalkyl, and CF₃; and

n' is selected from 1, 2, 3, and 4; and

d) a group of the formula:

\[ \text{\(Q\)} \]

\[ \text{\(Z^1\)} \]

\[ \text{\(Z^2\)} \]

wherein

Q is O, S, NR, \(^+\)N(O)(R), N(OR), \(^+\)N(O)(OR), or N−NR₂;

Z^1 and Z^2, when taken together, are \(-Q^1(C(R^p)_2);Q^1\–;\)

wherein

each Q^1 is independently O, S, or NR; and

each R^p is independently H, F, Cl, Br, I, OH, R, -C(=Q^2)R, -C(=Q^2)OR, -C(=Q^2)N(R)₂, -N(R)₂, -\(^+\)N(R)₃, -SR, -S(O)R, -S(O)₂R, -S(O)(OR), -S(O)₂(OR), -OC(=Q^2)R, -OC(=Q^2)OR, -OC(=Q^2)(N(R)₂), -SC(=Q^2)R, -SC(=Q^2)OR, -SC(=Q^2)(N(R)₂), -N(R)C(=Q^2)R, -N(R)C(=Q^2)OR, -N(R)C(=Q^2)N(R)₂, -SO₂NR₂, -CN, -N₃, -NO₂, -OR, or
or when taken together, two R² on the same carbon atom form a carbocyclic ring of 3 to 7 carbon atoms;

each Q² is independently, O, S, NR, *N(O)(R), N(OR),

*N(O)(OR), or N–NR₂;
or

Z¹ and Z³ are each, independently, a group of the Formula Ia:

![Formula Ia](image)

wherein:

each Q³ is independently a bond, O, CR₂, NR, *N(O)(R), N(OR),

*N(O)(OR), N–NR₂, S, S–S, S(O), or S(O)₂;

M2 is 0, 1 or 2;

each R⁸ is independently R⁸ or the formula:

![Formula with M1a, M1c, and M1d](image)

wherein:

each M1a, M1c, and M1d is independently 0 or 1;

M12c is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 or 12;

Z⁴ is Z⁴ or Z⁵;

Z⁴ is R, -C(Q²)R², -C(Q²)Z⁵, -SO₂R², or -SO₂Z⁵; and
$Z^5$ is a carbocycle or a heterocycle wherein $Z^5$ is independently substituted with 0 to 3 $R^v$ groups.

3. The method of claim 1 wherein $R^7$ is H.

4. The method of claim 1 wherein $R^7$ is selected from the group of
   a) $H$, -C(=O)R$^{11}$, -C(=O)OR$^{11}$, -C(=O)NR$^{11}$R$^{12}$, -C(=O)SR$^{11}$, -S(O)R$^{11}$, -S(O)_{2}R$^{11}$, -S(O)(OR$^{11}$), -S(O)_{2}(OR$^{11}$), -SO_{2}NR$^{11}$R$^{12}$,

   b) ![Diagram 1]

   and

   c) ![Diagram 2]

   wherein:

   $R^e$ is selected from phenyl, 1-naphthyl, 2-naphthyl,
R⁺ is H or CH₃;
R¹ and R² are each independently H or C₁-C₆ alkyl;
R⁷ is selected from H, C₁-C₆ alkyl, benzyl, C₃-C₆ cycloalkyl, and –CH₂-C₃-C₆ cycloalkyl;
R⁸ is selected from C₁-C₈ alkyl, -O-C₁-C₈ alkyl, benzyl, -O-benzyl, -CH₂-C₃-C₆ cycloalkyl, -O-CH₂-C₃-C₆ cycloalkyl, and CF₃;
and
n⁺ is selected from 1, 2, 3, and 4.

5. The method of claim 1 wherein R⁷ is

\[ \text{\textbf{structure}} \]

wherein Z¹ and Z² are each, independently, a group having the structure:

\[ \text{\textbf{structure}} \]

and Z³ is Z⁵.

6. The method of any of claims 1, 3 or 4 wherein R⁷ is

\[ \text{\textbf{structure}}, \text{\textbf{structure}}, \text{\textbf{structure}}, \text{\textbf{structure}} \]

or
wherein $Z^1$ and $Z^2$ are each, independently, a group having the structure:

and $Z^3$ is $Z^5$.

7. The method of claim 1 wherein $R^7$ is

wherein each $Q_{3b}$ is, independently, O or N(R).

8. The method of claim 7 wherein each $Q_{3b}$ is O and each $R^x$ is independently:

wherein M12c is 1, 2 or 3 and each $Q^3$ is independently a bond, O, CR$_2$, or S.

9. The method of any of claims 1 or 4-7 wherein $R^7$ is
10. The method of any of claims 1, 4 or 6 wherein $R^7$ is

$\text{HO-PO} - \text{HO}$

or

$\text{HO-PO-PO-PO}$

or

$\text{HO-PO-PO-PO}$

11. The method of any of claims 1 or 4 wherein $R^7$ is

$\text{R-PO-PO-PO}$

or

$\text{H-PO-PO-PO}$

wherein

$R^f$ is selected from the group of from H, C$_1$-C$_8$ alkyl, benzyl, C$_3$-C$_6$ cycloalkyl, and – CH$_2$-C$_3$-C$_6$ cycloalkyl.

12. The method of claim 11 wherein $R^f$ is C$_1$-C$_8$ alkyl.
13. The method of any of claims 1 or 4 wherein R⁷ is

\[
\text{HO-PO-} \quad \text{HO-PO-} \quad \text{HO-PO-}
\]

wherein

Rᵣ is selected from H, C₁-C₈ alkyl, benzyl, C₃-C₆ cycloalkyl, and -CH₂-C₃-C₆ cycloalkyl; and

Rᵣ is selected from C₁-C₈ alkyl, -O-C₁-C₈ alkyl, benzyl, -O-benzyl, -CH₂-C₃-C₆ cycloalkyl, -O-CH₂-C₃-C₆ cycloalkyl, and CF₃.

14. The method of any of claims 1, 4 or 13 wherein R⁷ is

\[
\text{R'F-O-P}_\text{NH} \quad \text{R'F-O-P}_\text{NH}
\]

wherein

Rᵣ is selected from H, C₁-C₈ alkyl, benzyl, C₃-C₆ cycloalkyl, and -CH₂-C₃-C₆ cycloalkyl.

15. The method of claim 14 wherein Rᵣ is C₁-C₈ alkyl.

16. The method of claim 14 wherein Rᵣ is C₁-C₆ alkyl.
17. The method of claims 1, 4 or 13 wherein $R^7$ is:

\[ \text{Diagram: } \]

wherein

$R^8$ is selected from C$_1$-C$_8$ alkyl, -O-C$_1$-C$_8$ alkyl, benzyl, -O-benzyl, -CH$_2$-C$_3$-C$_6$

cycloalkyl, -O-CH$_2$-C$_3$-C$_6$ cycloalkyl, and CF$_3$.

18. The method of claim 17 wherein $R^8$ is C$_1$-C$_8$ alkyl.

19. The method of claim 18 wherein $R^8$ is C$_1$-C$_6$ alkyl.

20. The method of any of claims 1, 4, 6, 10 or 13 wherein $R^7$ is selected from the group of:

\[ \text{Diagram: } \]

21. The method of any of claims 1, 4, 6, 10 or 13 wherein $R^7$ is:

\[ \text{Diagram: } \]
22. The method of claim 1 wherein the compound of Formula IV is:

or a pharmaceutically acceptable salt or ester thereof.

23. The method of claim 1 wherein the compound of Formula IV is:
or a pharmaceutically acceptable salt or ester thereof.

24. The method of claim 1 wherein the compound of Formula IV is:
or a pharmaceutically acceptable salt or ester thereof.

25. The method of claim 24 wherein the compound of Formula IV is:

![Chemical Structure](image)

or a pharmaceutically acceptable salt or ester thereof.

26. The method of any of claims 1-25 further comprising a pharmaceutically acceptable carrier or excipient.

27. The method of any of claims 1-25 further comprising administering a therapeutically effective amount of at least one other thereapeutic agent or composition thereof selected from the group consisting of a corticosteroid, an anti-inflammatory signal transduction modulator, a β2-adrenoreceptor agonist bronchodilator, an anticholinergic, a mucolytic agent, hypertonic saline and other drugs for treating Arenaviridae virus infections; or mixtures thereof.

28. The method of claim 27 wherein the at least one other thereapeutic agent is ribavirin, favipiravir (also known as T-705 or Avigan), T-705 monophosphate, T-705 diphosphate, T-705 triphosphate, ST-193, and mixtures thereof.

29. The method of any of claims 1-25 wherein the Arenaviridae infection is caused by an Arenaviridae virus.
30. The method of any of claims 1-25 wherein the Arenaviridae infection is caused by a Lassa virus.

31. The method of any of claims 1-25 wherein the Arenaviridae infection is caused by a Junin virus.

32. The method of any of claims 1-25 wherein the Arenaviridae infection is caused by a Lassa virus caused by a strain selected from Josiah, NL-z148, Macenta, AV, and CSF.

33. The method of any of claims 1-25 wherein an Arenaviridae polymerase is inhibited.

34. A compound as described in any of claims 1-25, or a pharmaceutically acceptable salt or ester thereof, for use in treating an Arenaviridae virus infection in a human.

35. A compound as described in any of claims 1-25, or a pharmaceutically acceptable salt or ester thereof, for use in treating a Lassa virus infection in a human.

36. The use of a compound as described in any of claims 1-25, or a pharmaceutically acceptable salt or ester thereof, for use in the preparation of a medicament useful in treating an Arenaviridae virus infection in a human.

37. The use of a compound as described in any of claims 1-25, or a pharmaceutically acceptable salt or ester thereof, for use in the preparation of a medicament useful in treating a lassa virus infection in a human.
38. A kit comprising one or more individual dosage units of a compound selected from those described in claims 1-25, or a pharmaceutically acceptable salt, ester, stereoisomer, hydrate, solvate, mixture of stereoisomers, or tautomer thereof, and directions for their use in treating an Arenaviridae viral infection in a human.

39. A method for treating a Coronaviridae infection in a human in need thereof comprising administering a therapeutically effective amount of a compound of Formula I:

![Chemical Structure](image)

or a pharmaceutically acceptable salt or ester, thereof;

wherein:

- each $R^1$ is H or halogen;
- each $R^2$, $R^3$, $R^4$ or $R^5$ is independently H, OR, N(R$_2$), N$_3$, CN, NO$_2$, S(O)$_n$R$_a$, halogen, (C$_1$–C$_8$)alkyl, (C$_4$–C$_8$)carbocyclicalkyl, (C$_1$–C$_8$)substituted alkyl, (C$_2$–C$_8$)alkenyl, (C$_2$–C$_8$)substituted alkenyl, (C$_2$–C$_8$)alkynyl or (C$_2$–C$_8$)substituted alkynyl;
- or any two $R^2$, $R^3$, $R^4$ or $R^5$ on adjacent carbon atoms when taken together are $-O(O)O-$ or when taken together with the ring carbon atoms to which they are attached form a double bond;
- $R^6$ is OR, N(R$_2$)$_2$, N$_3$, CN, NO$_2$, S(O)$_n$R$_a$, -C(=O)R, -C(=O)OR, -C(=O)NR$^1$R$^2$, -C(=O)SR$^1$, -S(O)R$^1$, -S(O)$_2$R$^1$, -S(O)(OR)$^1$, -S(O)$_2$(OR)$^1$, -SO$_2$NR$^1$R$^2$, halogen, (C$_1$–C$_8$)alkyl, (C$_4$–C$_8$)carbocyclicalkyl, (C$_1$–C$_8$)substituted alkyl,
(C₂–C₈)alkenyl, (C₂–C₈)substituted alkenyl, (C₂–C₈)alkynyl, (C₂–C₈)substituted alkynyl, or (C₆–C₂₀)aryl(C₁–C₈)alkyl;

R⁷ is selected from a group consisting of

a)  
H, \(-\text{C}(=\text{O})\text{R}^{11}\), \(-\text{C}(=\text{O})\text{OR}^{11}\), \(-\text{C}(=\text{O})\text{NR}^{11}\text{R}^{12}\), \(-\text{C}(=\text{O})\text{SR}^{11}\), \(-\text{S}(\text{O})\text{R}^{11}\), \(-\text{S}(\text{O})_{2}\text{R}^{11}\), \(-\text{S}(\text{O})(\text{OR})^{11}\), \(-\text{S}(\text{O})_{2}(\text{OR})^{11}\), or \(-\text{SO}_{2}\text{NR}^{11}\text{R}^{12}\),

59. The method of claim 39 wherein the compound of Formula IV is:

or a pharmaceutically acceptable salt or ester thereof.

60. The method of claim 39 wherein the compound of Formula IV is:
or a pharmaceutically acceptable salt or ester thereof.

61. The method of claim 39 wherein the compound of Formula IV is:
or a pharmaceutically acceptable salt or ester thereof.

62. The method of claim 61 wherein the compound of Formula IV is:

![Chemical Structure]

or a pharmaceutically acceptable salt or ester thereof.

63. The method of any of claims 39-62 further comprising a pharmaceutically acceptable carrier or excipient.

64. The method of any of claims 39-62 further comprising administering a therapeutically effective amount of at least one other therapeutic agent or composition thereof selected from the group consisting of a corticosteroid, an anti-inflammatory signal transduction modulator, a β2-adrenoreceptor agonist bronchodilator, an anticholinergic, a mucolytic agent, hypertonic saline and other drugs for treating a *Coronaviridae* virus infections; or mixtures thereof.

65. The method of any of claims 39-62 wherein the *Coronaviridae* infection is caused by a *Coronaviridae* virus.

66. The method of any of claims 39-62 wherein the *Coronaviridae* infection is caused by a *Coronaviridae* virus selected from SARS, MERS, 229E, NL63, OC43, and HKU1
67. The method of any of claims 39-62 wherein the *Coronaviridae* infection is caused by a SARS virus.

68. The method of any of claims 39-62 wherein the *Coronaviridae* infection is caused by a MERS virus.

69. The method of any of claims 39-62 wherein a *Coronaviridae* polymerase is inhibited.

70. A compound as described in any of claims 39-62, or a pharmaceutically acceptable salt or ester thereof, for use in treating a *Coronaviridae* virus infection in a human.

71. A compound as described in any of claims 39-62, or a pharmaceutically acceptable salt or ester thereof, for use in treating a SARS virus infection in a human.

72. A compound as described in any of claims 39-62, or a pharmaceutically acceptable salt or ester thereof, for use in treating a MERS virus infection in a human.

73. The use of a compound as described in any of claims 39-62, or a pharmaceutically acceptable salt or ester thereof, for use in the preparation of a medicament useful in treating a *Coronaviridae* virus infection in a human.

74. A kit comprising one or more individual dosage units of a compound selected from those described in claims 39-62, or a pharmaceutically acceptable salt, ester, stereoisomer, hydrate, solvate, mixture of stereoisomers, or tautomer thereof, and directions for their use in treating a *Coronaviridae* viral infection in a human.

A. CLASSIFICATION OF SUBJECT MATTER

ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

A61K A61P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

EPO-Internal, EMBASE, WPI Data
