

Basis of the amendments

In the amended claims 1 and 3 we have added that the entrance (5) to the room (6) turns downwards.

This ensures that the rat is completely inside the room prior to the release of the plunger and that the rat after the killing falls out of the trap by itself via the opening (5).

This ensures great accuracy of strike, as the rat does not have time to escape the room, if it hears the sound from the plunger release, and as the rat itself “empties” the trap, it is ready for use again.

Claim 2 is unchanged.
